RESULTS OF THE FIFTH INTERNATIONAL SPRING WHEAT YIELD NURSERY, 1968 - 1969

Compiled by: DAVID R. MACKENZIE, Rockefeller Foundation Post-doctoral fellow.

Computer Programming by: ABEL G. MEXAS, Ford Foundation Statistician and Director Computing Center, Chapingo Agricultural College, Chapingo, Mexico.

Under the Direction of: NORMAN E. BORLAUG, Director Wheat Program, CIMMYT, and KEITH W. FINLAY, Deputy Director General, CIMMYT.

ACKNOWLEDGMENTS

The excellent cooperation of all participants, and in particular Dr. A. Hafiz, Regional Consultant, F.A.O., Near East Wheat and Barley Improvement Project, Cairo, U.A.R., who organized and supervised the experiments in the Near and Middle East, is appreciated.

We are again indebted to Mr. Arthur Mancini and his staff at RCA Computer Systems Division of Mexico for their excellent assistance in the rapid data summarization necessary for this report. Our special thanks to the staff of Centro de Investigaciones Agricolas del Noroeste (CIANO) for growing the seed for this experiment and to Reyes Vega and Miguel Martinez for their help in preparing the Nurseries. To Mrs. Mina Hardy for administering to the necessary details and Miss Gloria Garcia for preparation of the data, tables and manuscript we extend our sincere thanks.

Funds for the support of this project are received from the Rockefeller Foundation, The Ford Foundation and U.S. AID.

RESULTS OF THE FIFTH INTERNATIONAL SPRING WHEAT YIELD NURSERY 1968-1969

ABSTRACT

The Fifth International Spring Wheat Yield Nursery (ISWYN) was composed of 50 spring wheat varieties representative of the major spring wheat types. Data, received from 63 locations throughout the spring wheat regions of the world, included yield, agronomic traits and disease reactions. Statistical analyses and location summaries are presented for all traits measured at each reporting location.

Over all reporting locations Penjamo 62, Lerma Rojo 64 — Norin 10-Brevor x Andes (3), Pitic 62, Siete Cerros and Sonora 64-Klein Rendidor were the top yielding varieties in that order. Tobari 66 and Huelquen gave the best performance under all three rusts over all locations, but ranked 12 and 16 for yield, respectively.

INTRODUCTION

The commitment to test internationally promising spring wheat varieties and lines has proven a worthwhile investment. The cooperation received from our collaborators around the world has been the major reason for their success. From these studies it has been possible to identify current varieties and lines which are widely adapted or well suited for production areas where there is interest in increasing yields. In addition, wheat breeders have found this information useful in planning crosses to obtain better varieties.

Another aspect of this project was the systematic assessment of this data for insight into the reasons for good (or bad) performance of varieties across locations and years. This data file is now being prepared for a six-year summary report to the cooperators. We are hopeful that the true potential of this effort will soon be realized.

This report presents the results of the Fifth ISWYN using the same format as the Third and Fourth ISWYN's.

METHODS AND MATERIALS

Seed for the Fifth ISWYN was produced in increase plots at the Centro de Investigaciones Agrícolas del Noroeste (CIANO) at Ciudad Obregon, Sonora, Mexico, during the 1967-68 growing season. The seed was treated with a Vitavax (registered trademark for 5, 6-dihydro-2-methyl-1, 4-oxathiin-3-carboxanilide) disinfectant prior to packeting. The plots consisted of six, 2.5 meter rows with three replications. Instructions concerning seeding, nursery management and note-taking, as well as data sheets, were included with each set of seed.

The fifty varieties (*Triticum aestivum*) in the nursery represent the principle varietal types of spring wheat grown in many areas of the world.

Some of the varieties had been included in previous international nurseries (1,2,3,4,5,6,7,8,9,10,11) and others were chosen from submissions because they exhibited some outstanding trait in specific regions. An attempt was made to balance previous entries and new entries to keep the nursery current and meaningful.

The varieties entered for testing in the Fifth ISWYN were¹:

ARGENTINA

**Gaboto*: Bagé 2018 x H 44-Sinvaloch MAG/Bagé 1971/37 — One of the most important soft grained varieties in the northern part of the Argentina wheat belt. It is considered resistant to *Septoria* sp., Fusarium and rusts.

**Sonora 64-Klein Rendidor*: A line of promising yield potential and broad adaptation. It is of intermediate maturity, semi-dwarf and has good disease resistance. It has some cold tolerance and has shown tolerance to *Septoria* in some parts of the world, especially North Africa and the Middle East.

**Sonora 64 x SK-E-Lerma Rojo 64A*: A promising semi-dwarf line selected under Argentine conditions.

**Sonora 64 x Tezanos Pintos Precoz-Nainari 60 (A)*: Sister line of Jaral 66 and the Third ISWYN entry Jaral "S". This line was selected in Argentina and shows promise of a high yield potential, good resistance to stem and stripe rust, strong gluten and early maturity. One defect is low grain test weight.

AUSTRALIA

**Gabo*: Bobin²-Gaza — An Australian variety of very wide adaptation. It is very susceptible to stripe rust.

Mengavi: Gabo⁶-Mentana/Gabo² x Eureka-CI 12632 — This variety has good resistance to stem rust, but is susceptible to leaf rust and flag smut.

**Triple Dirk*: A version of Dirk with additional genes for stem rust resistance. It has been grown commercially in Pakistan and India. It may be the only Australian variety with resistance to stripe rust. It was an entry in the Third ISWYN.

BRAZIL

**Carazinho*: Colonista-Frontana — A soft red commercial variety reported to be able to produce relatively good yield on acid soils. It has good stripe rust resistance under most conditions.

¹ Pedigree notations are: "S" = sib; E = dwarf and superscript numerals = number of backcrosses.

* An asterisk preceding a variety or cross indicates entry in a previous ISWYN.

CANADA

**Selkirk*: McMurachy-Exchange x Redman³ — Until recently, the most extensively grown variety in the moist parts of the northern hard red spring wheat areas. It is stem rust resistant.

Manitou: Thatcher⁷-Frontana x Thatcher⁶-Kenya Farmer/Thatcher⁶-PI 170925 — A tall variety with good resistance to stem rust. It is susceptible to leaf rust.

CHILE

**Huelquen*: The most widely grown commercial variety in Chile. It has shown good resistance to all three rusts and high yield potential. It is normal in height.

*Nariño (S)*²-*Penjamo (S)*: An experimental semi-dwarf line with soft grain.

COLOMBIA

**Bonza 55*: Yanqui 50-Kentana 48 II-2254-2P-111B-4B-1B — An important commercial variety in Colombia and Ecuador which has maintained an effective level of resistance to both stripe and stem rust for 15 years. This is unique with the explosive stripe rust race situation in Colombia.

**Crespo 63*: [Frocor (Newthatch/Mentana²-Kenya x Bagé)] x Gabo II-11263-3T-1B-2T-1B-1T — A commercial variety released jointly by Ecuador and Colombia, having a good level of field resistance to stripe rust.

**Napo 63*: Frocor-Frontana/Yaqui 48 x Nariño "S" II-9314-22T-1B-1T — An important variety in both Colombia and Ecuador showing very good resistance to stem and stripe rusts.

EGYPT

Giza 155: A white grained variety of high test weight.

GERMANY

Kloka WM 1353: A tall, late maturing variety of unknown adaptability.

INDIA

**C-306*: [(Regent 1974 x Chz 3) C 591²] x (P 19 x C 281) — This medium tall variety of average straw strength was bred for the central districts of Punjab. It is full bearded with pubescent chaff. It is considered tolerant to the rusts, but is susceptible to loose smut.

**C-591*: Punjab Type 8B-Punjab Type 9 — Another pre-partition variety released in 1934 and still used in some areas. This high yielding strain has hard, bold, lustrous, amber grains. The glumes are a little less pubescent and the straw is weaker than C-518. It is noted for susceptibility to loose smut, stem and leaf rusts.

NP-832: No descriptive information available.

NP-852: An old, tall, weak strained Indian variety with large, white seed. It has limited yield potential, but is resistant to *Alternaria* sp. under Indian conditions. It is susceptible to the rusts.

*NP-881: A tall variety bred by the Indian Agricultural Research Institute. It was included in the Third ISWYN.

PV-18, INDUS: Penjamo "S"-Gabo 55 8156 selection — A red kernel reselection of the Siete Cerros and Super X cross.

V-878: No descriptive information available.

ITALY

Victor I: VZ 133 Mara 3 x FN-K58-N — A promising breeding line of late maturity, intermediate habit and good yield potential. It is susceptible to leaf and stem rust, but has moderate resistance to stripe rust. In North Africa, Near and Middle East, it has shown resistance to *Septoria* sp. Defects are low test weight and weak gluten.

KENYA

(MD-K-Y) (Wis-Sup): 4625-HD3 — A new semi-dwarf variety with good resistance to stem rust.

MEXICO

*CIANO F67: Pitic 64-Chris "S" x Sonora 64 19957-18m-1y-3m-9y. Named for the "Centro de Investigaciones Agricolas del Noroeste", this variety is early, disease resistant and has good baking qualities. Limited results suggest moderate to good yield potential under some conditions.

*Inia 66: Lerma Rojo 64-Sonora 64 19008-83M-100Y-100M-100Y-100C — This joint release from CIMMYT and INIA (Instituto Nacional de Investigaciones Agricolas) programs is the earliest semi-dwarf now available and has shown excellent baking qualities, good yield potential, lodging resistance and resistance to many races of stem and stripe rusts. It is susceptible to bunt and barley yellow dwarf. White chaff and red seed characterize this variety.

*Lerma Rojo 64A: [(Yaqui 50 x Norin 10-Brevor) Lerma 52] Lerma Rojo² 8724-8Y-1C-1Y — A semi-dwarf version of the original Lerma Rojo, derived through backcrossing, that has shown good adaptation in the Near East and Mexico. It is resistant to many races of stem and stripe rusts, but susceptible to bunt and powdery mildew.

*Lerma Rojo 64-Sonora 64: 19008-52M-6Y-7M-101C — A close sister line of Norteño and relative of Inia 66 and Noroeste 66. This promising breeding line has bronze chaff, white seed, but is susceptible to shattering.

*Nainari 60: [(Supremo-Mentana x Gabo) Thatcher-Queretaro x Kenya-Mentana] Gabo P 4160-6H-3Y-2C — A tall variety now largely replaced by semi-dwarfs in Mexico. This once important commercial variety is still widely used in crossing programs. It has shown good adaptation in several Near Eastern countries and in the Inter-American International Yield Nurseries.

**Noroeste* 66: Lerma Rojo 64-Sonora 64 19008-52M-4Y-4M-2Y — A sister line of Inia 66 with slightly less yield potential, but good disease resistance. It is susceptible to shattering.

**Norteño* M67: Lerma Rojo 64-Sonora 64 19008-52M-6Y-3M-2Y — A sister line of Inia 66 and Noroeste 66 entered in this nursery to test suspected high yield potential under some conditions. This bronze chaff, large white seeded variety of good test weight and resistance to the three rusts is also susceptible to shattering.

**Penjamo* 62: (Frontana x Kenya 58-Newthatch) Norin 10-Brevor 7078-1R-6M-1R-1M — One of the first Mexican semi-dwarfs, this variety is still grown in a number of countries. It has broad adaptation.

**Pitic* 62: Yaktana 54 x Norin 10-Brevor 26-1C 7064-1Y-1H-1R-2M — First semi-dwarf variety released in Mexico, this high yielding variety has done well in the Inter-American nurseries, all three Near East-American nurseries and the first two ISWYN's. Currently its use is declining in Mexico because of low test weight and susceptibility to current races of stem rust. It is being grown commercially in a number of other countries.

**Siete Cerros* 66: Penjamo "S"-Gabo 55 8156-1M-2R-4M — A white grained, dwarf variety of very high yield potential and broad adaptation. This variety and its red seeded sister, Super X, and reselections are referred to under various names including 8156, Kalyansona, S-227, PV-18, Indus 66 and Mexipak 65. These are now grown widely in Pakistan, India and other Near Eastern countries.

**Sonora* 64: (Yaktana 54 x Norin 10 Brevor) Yaqui 54² 8469-2Y-6C-6Y-4C-2Y-1C — Once the most widely grown semi-dwarf wheat in Mexico. It has medium sized red grain of good quality. This lodging resistant variety is awned and has off-white glumes. It is a valuable parent in several breeding programs because of its light insensitivity, earliness, high yield potential and good combining ability. Currently it is recommended only for areas where the rusts are not a problem due to its susceptibility to new races.

Tezanos Pintos Precoz-Sonora 64/Lerma Rojo 64A-Tezanos Pintos Precoz x Andes (E) (A): 22429-11M-1Y-1M-0Y — A new semi-dwarf line with one gene for dwarfing. This line and the next have shown promise in local testing. It has strong gluten.

Tezanos Pintos Precoz-Sonora 64/Lerma Rojo 64A-Tezanos Pintos Precoz x Andes (E) (B): 22429-16M-1Y-1M-0Y — Sister line of the above variety.

**Tobari* 66: Tezanos Pintos Precoz-Sonora 64A 19021-4M-3Y-102M-100Y-101C — A red seeded dwarf variety with good quality and outstanding disease resistance. The yield potential may not be as high as Siete Cerros. It is widely grown in several countries.

PAKISTAN

**C-273*: C591-C209 — A tall, awned, pubescent, white seeded variety grown commercially in the Punjab areas of India and Pakistan.

SUDAN

L 1418-3463L 1231 x 23L1274-111 (L): No descriptive information available.

Lerma Rojo 64-Norin 10-Brevor x Andes (3): Limited testing suggests a high yield potential for this new semi-dwarf line. It is considered resistant to *Septoria* sp., but is known to be susceptible to stem rust.

36896-CJ54 (2) x Yaktana 54A (H): This semi-dwarf selection has a large head and has some resistance to the three rusts.

TAIWAN

Thichung 31: Included in this experiment as a sample of a different gene pool.

UNITED STATES OF AMERICA

**Chris*: CI 13751 Frontana-Thatcher x II-44-29-Thatcher² — A variety developed in Minnesota with excellent quality, good disease resistance and acceptable yield potential. It is widely grown in the U.S.A. and Canada. This variety, listed previously as Minn II 53-525, is considered tall and partially light sensitive.

**Crim*: CI 13465 Klein Titan-Thatcher³ x II-44-29-Thatcher² — This Minnesota variety has good quality, acceptable yield potential and disease resistance. However, it is tall and light sensitive.

**Justin*: CI 13462 (Thatcher-Kenya Farmer x Lee-Mida) Conley — Developed in North Dakota and grown in North Dakota and Minnesota. This variety has good quality, but low yield. It is considered light sensitive and tall.

**Thatcher*: Marquis-Iumillo x Kanred-Marquis — A Minnesota variety that was widely grown for many years in the northern United States and Canada and is still grown in the drier areas of that region. It has been used as a standard for spring wheat quality and for that reason has been widely used in the parentage of many of the newer U.S. and Canadian lines. It is extremely day length sensitive.

DATA SUMMARIZATION

The metric system and percentages were chosen as the units of measurement for presentation. When possible other systems were converted to the appropriate standard before computations were made. Every effort was made to assure the correctness of such conversions as well as the accuracy of translations of terms from other languages and interpretation of supplementary information. CIMMYT, however, takes full responsibility for any errors that may have been made. Data were neither analyzed, nor are presented, for traits when no differential effect was observed.

Yield data were requested from the four center rows of a six-row plot. Yields were converted from the units reported by the cooperator to kilograms per hectare (kg/ha). For readers more accustomed to yield in

bushels per acre, 1,000 kg/ha is approximately 15 bushels per acre for wheat.

Both test weights and 1,000 grain weights were requested because some cooperators do not have test weight equipment. The weights are reported in kilograms per hectoliter (kg/hl) and 1,000 grain weights are reported in grams. For readers more accustomed to test weights expressed in pounds per bushel, 75 kg/hl is roughly equivalent to 60 pounds per bushel.

Disease¹ notes were requested from cooperators when differential reactions were observed. Rust reactions were most commonly recorded with the international rust scale noting the percentage leaf area infected and reaction type (i.e. lesion size). For statistical analyses these rust notes were converted to a coefficient of infection as used by Dr. W. Q. Loegering (U.S.D.A. International Spring Wheat Rust Nursery 1959). This coefficient is calculated by multiplying the percentage of infection by a "response value" assigned to each infection type. Thus, the coefficient combines both the amount of infection and the reaction type. The response values are given in the following table:

| Reaction Type | Abbreviation | Response value |
|------------------------------|--------------|----------------|
| 0 | | 0.0 |
| Very resistant and resistant | VR and R | 0.2 |
| Moderately resistant | MR | 0.4 |
| Intermediate | M or X | 0.6 |
| Moderately susceptible | MS | 0.8 |
| Susceptible | S and VS | 1.0 |

As examples, 20 MS is expressed as $(20 \times 0.8) = 16.0$ and 10 MR is expressed as $(10 \times 0.4) = 4.0$. Ranges of reaction are averaged, such that 5R-15S becomes 6.0 ($5 + 15 = 10$ and $0.2 + 1.0 = 0.6$) with 6.0 the product of 10×0.6 .

$$\frac{2}{2}$$

When cooperators reported only percentage of rust, the value was used directly. The occurrence of 0 values, plus the fact that the coefficients do not usually fit a normal distribution, requires that the coefficients be transformed to $\sqrt{\text{coefficient}} + 1.0$. The addition of one unit to the coefficient eliminates all zero values and past experience has shown that the square root determination helps to improve the normality of the distributions.

The transformed coefficients can be analyzed statistically as well as correlated with other traits (e.g. yield). However, for tabular presentation in

¹ For simplicity of reporting, all plant diseases are referred to by one common name. The following common names have been selected, followed by the causal agent in parentheses. Stem rust (*Puccinia graminis tritici*); leaf rust (*Puccinia recondita*); stripe rust (*Puccinia striiformis*); mildew (*Erysiphe graminis tritici*) and Septoria (*Septoria spp.*). For this last disease, distinction between the causal species has not always been possible from information supplied by cooperators.

this report, the standard rust scale notes from the first replication at each location are presented since the coefficients are more difficult to use in visualizing the response of a particular variety. The mean rust reaction by location is presented with its related statistics as an index of the amount of rust at that location. Relatively low mean rust values indicate low incidence and/or virulence of the pathogen. Higher means are indicative of a higher incidence and/or virulence. Thus, these means provide a relative location comparison and a reflection of the extent of that pathogen in that nursery under the environmental conditions that existed.

Other indices of varietal performance were analyzed whenever possible and are presented in the tables. Most of these values were percentages. Several indices could be transformed to percent. In those instances where the scale used by the cooperator could not be converted to percent, the scale values are given. The percentage values were not transformed to $\sqrt{\%} + 1$, as had been done previously. While some may consider transformation necessary, comprehension of the mean of a transformation is difficult. It was felt that it would be better to present values which were more readily comparable to the field scores used by collaborators.

The grand mean of each trait was calculated and are presented with pertinent statistics in the Tables. Previously, error estimates were calculated indirectly as residuals. Since incomplete data sets are often reported, indirect estimations of the error variance can give biased or even negative values. Therefore, estimated error variances were computed directly for all traits reported. This value was then used to calculate a standard error ratio of the grand mean, a coefficient of variation (the ratio of the standard deviation to the grand mean expressed as a percentage) and the least significant difference (LSD) at the 5% level. The coefficient of variation is useful as a unit basis comparison of variation between locations. The LSD_{0.5} can be used to compare two variety means at the same locations.

Considerable insight into factors influencing yield can sometimes be gained by correlation studies. Correlations were performed on all possible pairs of factors by location using the mean value for each trait reported. Correlations were computed on the replication means rather than the raw values because some types of data were frequently reported for only one replication. The population size is fairly small for this type of analysis and some spurious correlations may be encountered. Discretion is advised in interpretation of these values. Many workers find correlation analyses interesting and useful and they are presented as part of the summary table for each location with an awareness of their limitations.

The overall location means were computed for each variable and are presented herein when the number of observations justified inclusion. With the exception of the rust data the reported units are those used throughout this report. For arithmetic purposes the mean rust reactions were computed on the transformed values ($\sqrt{X} + 1$) where 1.0 would be no rust and 10.0 is complete susceptibility. Relative comparisons are suggested for selecting potentially useful rust resistant varieties. Average values

of less than 2.0 can be considered as quite resistant, while varieties with values greater than 2.5 must be considered as susceptible.

Many problems have been encountered in the analyses and summary of these unique data. It has been our attempt to provide the reader with maximum amount of usable information and yet not confuse the picture with a great deal of computation detail.

RESULTS AND DISCUSSION

Sixty-three trials were returned for the Fifth ISWYN. Figure 1 presents the reporting location with the corresponding table numbers. The test sites were as varied as previous ISWYN's as indicated by Figure 2.

Inspection of individual locations (Tables 1-63) may offer readers more insight into the suitability of varieties to match specific conditions. The table format selected for the Third ISWYN was used again to assist individuals in variety evaluation at specific locations, and to help identify potentially useful varieties for direct use or as parents in a breeding program.

Table 64 presents the overall mean values of each variety for those variables recorded with sufficient frequency to justify reporting. This table is ranked in descending order for mean yield.

Only two of the new entries in this nursery were ranked in the top 10 for overall yield. These selections, Lerma Rojo 64-N10B x AN (3) and PV 18 Indus ranked second and eighth, respectively. Of the eight previously tested submissions all were in the top ten of the Fourth ISWYN except Lerma Rojo 64A, which ranked 14th for overall yield. All of the top ten of this experiment which were included in the Third were also in the top ten of that report.

This similarity in results of common varieties points out the stability of broad adaptability and invites the question of how best to characterize and capitalize on this trait in an active breeding program.

We at CIMMYT are now investigating the implications of these results and look forward to being able to offer suggestions in the near future. As mentioned previously, a report will be forthcoming dealing with this aspect of the project.

TABLE 2

NORTH AMERICA

UNITED STATES OF AMERICA. Isleton, California. Latitude: $38^{\circ} 32' N.$ Longitude: $121^{\circ} 45' W.$ Elevation: 6.4 meters below sea level.
 Cooperators: C. O. Qualset, J. A. Rupert, H. E. Vogt and J. T. Feather.

Planting Date: 21 December 1968. Precipitation during test: not stated. Irrigation: none. Fertilizer: none (test followed heavily fertilized tomato crop).

General Comments: There was excessive rain during the winter. Stripe rust infection was severe. No insect, weed or pest problems.

Scoring notes taken: Stripe rust - 28 May.

TABLE 4

NORTH AMERICA

UNITED STATES OF AMERICA. Pullman, Washington. Latitude: $46^{\circ} 42' N.$ Longitude: $117^{\circ} 8' W.$ Elevation: 762 meters above sea level.
 Cooperators: C. F. Konzak and Michael Davis.

Planting Date: 20 April 1969. Precipitation during test: 596.9 mm. Irrigation: none. Fertilizer: 67.2 Kg./Ha. $NH_4 NO_3$.
General Comments: Cool spring with average rainfall. Stripe rust and leaf rust were prevalent on all susceptible varieties.

Scoring notes taken: Stripe and leaf rust - 20 June, lodging - 20 July, shattering - 6 August.

TABLE 7

NORTH AMERICA

UNITED STATES OF AMERICA. Ft. Collins, Colorado. (Cargill, Inc.) Latitude: 40° 35' N. Longitude: 105° 05' E. Elevation: 1524 meters above sea level.
 Cooperators: B. C. Curtis, B. J. Roberts and D. R. Johnston.

Planting Date: 9 April 1969. Precipitation during test: not stated. Irrigation: 305 mm. Fertilizer: 89.6 Kg./Ha. N, 22.4 Kg./Ha. P₂O₅ and 22.4 Kg./Ha. K₂.
General Comments: The spring was cool and wet through flowering time, then it turned hot and dry. There was artificial inoculation of stem rust and a natural infection of leaf rust. No insect weed or pest problems.

Scoring notes taken: Shattering - 14 August.

TABLE 8

NORTH AMERICA

UNITED STATES OF AMERICA. Casselton, North Dakota. (DeKalb Spring Wheat Station) Latitude: 47° N. Longitude: 97° W. Elevation: 280 meters above sea level. Cooperators: DeKalb Agricultural Research, Inc.

Planting Date: 25 April 1969. Precipitation during test: 507.2 mm total from September 1968 to August 1969. Irrigation: none. Fertilizer: 50.4 Kg./Ha. N (NH_4NO_3), 67.2 Kg./Ha. P_2O_5 and 50.4 Kg./Ha. K.

General Comments: Spring and early summer were cool and wet. August was warm and dry. Both leaf and stem rust infections were late developing. After that a considerable amount of inoculum was present. Septoria level was high. No insect, weed or pest problems.

TABLE 9

NORTH AMERICA

CANADA. Winnipeg, Manitoba. Latitude: 50° N. Longitude: 97° W. Elevation: 230 meters above sea level.
 Cooperator: A. B. Campbell.

Planting Date: 21 May 1969. Precipitation during test: 235.2 mm total from 21 May to 16 August. Irrigation: none. Fertilizer: 448 Kg./Ha. 27-14-0.
General Comments: The weather was cool and wet during the growing season. Rust infection was heavy on susceptible varieties. Weeds were controlled by spraying.

Scoring notes taken: Leaf rust - 9 August, height - 13 August, days to maturity and lodging - 18 August to 2 September, stem rust - 26 August.

TABLE 10

NORTH AMERICA

UNITED STATES OF AMERICA. Eden Prairie, Minnesota. Latitude: 44° 49' 38" N. Longitude: 93° 27' 24" W. Elevation: 277 meters above sea level.
 Cooperators: R. W. Romig and W. Althaus.

Planting Date: 20 April 1969. Precipitation during test: 234 mm. Irrigation: 76.2 mm. Fertilizer: 250 Kg./Ha. 8-16-16 and 100 Kg./Ha. 30-0-0.

General Comments: Mean monthly temperatures were May 15.8°C, June 16.6°C and July 21.1°C. Septoria infection was severe, root rot and scab were prevalent. Leaf and stem rust developed late. There were slight problems with weeds and with wheat stem maggot.

Scoring notes taken: Days to flowering - 15 June, height - 9 July, Septoria - 16 July, leaf rust - 21 July, stem rust and lodging - 4 August.

 Cooperator: R. E. Heiner.

Planting Date: 30 April 1969. Precipitation during test: 264 mm. Irrigation: none. Fertilizer: 28 Kg./Ha. Amm. Nitrate Actual.

General Comments: April and May were warmer than normal. June was colder than normal and there was below average rainfall. Disease development in general was not too severe. Leaf and stem rust developed late. No insect, weed or pest problems were observed.

Scoring notes taken: Days to flowering - 20 to 26 June, lodging - 11 to 16 July, leaf rust - 14 July, stem rust - 21 July and height - 9 and 10 July.

TABLE 13

EUROPE

PORUTGAL. Elvas. (Estacao do Melhoramento do Plantas) Latitude: 38° 53' N. Longitude: 7° 9' W. Elevation: 208 meters above sea level.
 Cooperators: M. T. Barradas and F. Bagulho.

Planting Date: 20 November 1968. Precipitation during test: 645.3 mm from 20 November to 10 June. Irrigation: none. Fertilizer: 126 Kg./Ha. N, 42 Kg./Ha. P₂O₅ and 48 Kg./Ha. K₂O.

General Comments: Winter was rainy. Spring was fresh, damp and long. The Septoria epidemic was severe. Stripe rust level was normal and stem rust was below normal. Minor problems were encountered due to cephush and to birds.

Scoring notes taken: Septoria tritici - 24 April, stripe rust - 13 May, stem rust - 9 June, lodging - 2 June, shattering - 26 June.

TABLE 16

EUROPE

YUGOSLAVIA. Novi Sad. Latitude: 45.5° N. Longitude: 19.8° E. Elevation: 84 meters above sea level.

Cooperators: Dr. Slavko Borojevic.

Planting Date: 3 April 1969. Precipitation during test: 217 mm. Irrigation: 30 mm. Fertilizer: 125 Kg./Ha. N, 93.5 Kg./Ha. P and 80 Kg./Ha. K.

General Comments: Winter was mild, with snow cover. In general the climatic conditions were not favorable for the experiment. Disease development was medium severe. No insect, weed or pest problems.

TABLE 17

EUROPE

YUGOSLAVIA. Zagreb. Latitude: 45° 45' N. Longitude: 15° 56' E. Elevation: 116 meters above sea level.
 Cooperator: Dr. Z. Martinic.

Planting Date: 25 March 1969. Precipitation during test: 467 mm (approximately 25% more than average). Irrigation: none. Fertilizer: 80 Kg./Ha. N (2 x 40), 150 Kg./Ha. P₂O₅, 140 Kg./Ha. K₂O.

General Comments: March, April, June and July were cooler than normal, which was favorable. May was warmer than usual. Conditions were favorable for leaf rust, mildew, Septoria sp. and Fusarium. Weeds were controlled mechanically. No insect or pest problems.

TABLE 19

MIDDLE EAST

TURKEY. Adapazari. (Regional Agricultural Experiment Station) Latitude: $40^{\circ} 47' N.$ Longitude: $29^{\circ} 38' E.$ Elevation: 33 meters above sea level.
 Cooperator: Sadettin Demiröz.

Planting Date: 4 January 1969. Precipitation during test: 669.9 mm total from 4 December 1968 to 3 July 1969. Irrigation: none. Fertilizer: 140 Kg./Ha. N, 70 Kg./Ha. P and 40 Kg./Ha. K.

General Comments: Climatic conditions were usually rainy. There were natural epiphytotes of stripe, leaf and stem rusts. No insect, weed or pest problems.

Scoring notes taken: Days to flowering - 14 to 21 May, rusts - 19 May to 24 June, height - 30 May, lodging - 8 to 30 June, shattering - 17 June to 2 July, days to maturity - 20 June to 2 July.

TABLE 20

MIDDLE EAST

TURKEY. Eskisehir. (Plant Improvement Station) Latitude: 36° 45' N. Longitude: 30° 95' E. Elevation: 789 meters above sea level.
 Cooperators: Mr. T. Atay and Mr. F. Altay

Planting Date: 3 April 1969. Precipitation during test: 457.4 mm total from 1 September to 30 August. Irrigation: approximately 180 mm. Fertilizer: 60 Kg./Ha. P₂O₅ as Superphosphate.

General Comments: There was a rainy fall, winter and spring, favorable for rust development. Stripe rust infection was severe.

Scoring notes taken: Stripe rust - 8 June, leaf rust - 28 June, stem rust - 3 July, height - 2 August, lodging and shattering - 7 August.

TABLE 22

MIDDLE EAST

LEBANON. Tel-Amara. Latitude: 33° 55' N. Longitude: 35° 28' E. Elevation: 950 meters above sea level.
 Cooperator: Michel Abi-Antoun.

Planting Date: 17 November 1968. Precipitation during test: 902 mm. Irrigation: none. Fertilizer: 150 Kg./Ha. N and 75 Kg./Ha. P₂O₅.
General Comments: An extremely wet growing season. Heavy development of rusts. No insect, weed or pest problems.

TABLE 23

MIDDLE EAST

LEBANON. AUB, Beq'a Plain. (Agricultural Research and Education Center) Latitude: 33° 55.5' N. Longitude: 36° 4.5' E. Elevation: 995 meters above sea level. Cooperator: W. W. Worzella.

Planting Date: 20 November 1969. Precipitation during test: 891 mm. Irrigation: none. Fertilizer: Superphosphate (20%) and Amm. Sulphate (20%).

General Comments: Conditions were not favorable for the experiment. Rainfall during the growing season was double the normal amount. The stripe rust epidemic was severe. Hail damaged the earlier varieties to a greater extent than the later varieties. No insect, weed or pest problems.

TABLE 24

MIDDLE EAST

SYRIA. Karahta, Damascus. Latitude: 29° N. Longitude: 16° E. Elevation: 620 meters above sea level.
 Cooperator: A. K. Kaueider.

Planting Date: 3 December 1968. Precipitation during test: not stated. Irrigation: 6 irrigations applied. Fertilizer: 800 and 600 Kg./Ha. $(\text{NH}_4)_2\text{SO}_4\text{S}$. Phos.

General Comments: Climatic conditions were normal and good. General infection of stripe rust.

Scoring notes taken: Days to flowering - 24 March to 29 April, rusts - 24 March to 11 May, lodging - 13 May, days to maturity - 13 May to 2 June, height - 15 to 20 May, shattering - 15 to 18 June.

TABLE 25

ISRAEL. Mivhor Farm. (Hazera Seeds, Ltd., Breeding Department) Latitude: $31^{\circ} 37' N.$ Longitude: $34^{\circ} 47' E.$ Elevation: 120 meters above sea level.
 Cooperators: Sem Y. Atsmon.

Planting Date: 15 December 1969. Precipitation during test: 357.1 mm total from October to April. Irrigation: Three applications totaling $1800 m^3/Ha.$

Fertilizer: Preplanting application of 12-12-0 plus Urea topdress of 60 Kg./Ha.

General Comments: There was a prolonged dry spell lasting from 29 January to 10 March. The average temperatures during that period were from $1-3^{\circ} C$ above average. Septoria, stripe and leaf rusts were heavy. Stem rust infection was moderate.

Scoring notes taken: Stripe rust, leaf rust and lodging - 8 April, stem rust and height - 27 April.

TABLE 28

MIDDLE EAST

IRAN. Ahwaz, Khuzistan. Latitude: 31° 20' N. Longitude: 48° 40' E. Elevation: 20 meters above sea level.
 Cooperator: M. Dadain.

Planting Date: 24 November 1968. Precipitation during test: 294 mm. Irrigation: 5 irrigations applied. Fertilizer: 60 Kg./Ha. N as Urea, 30 Kg./Ha. P₂O₅ as Superphosphate.

General Comments: Temperature varied between 2.4°C and 43°C during the test. Strong development of leaf rust. No insect, weed or pest problems.

TABLE 30

ASIA

AFGHANISTAN. Darul Aman Experiment Station. Latitude: $34^{\circ} 33' N.$ Longitude: $69^{\circ} 11' E.$ Elevation: 1803 meters above sea level.
 Cooperators: Atif Hakim and E. V. Staker.

Planting Date: 25 and 26 September 1968. Precipitation during test: Practically no rain during period May-August. Average annual precipitation for Kabul (8 years) is 358.5 mm. Irrigation: 5 irrigations of 76.2 mm each were applied. Fertilizer: 100 Kg./Ha. N as Urea in fall broadcast; 100 Kg./Ha. N as Urea in spring, banded; 100 Kg./Ha. P_2O_5 as 18% Superphosphate in fall, banded; and 50 Kg./Ha. K_2O as Potassium Chloride in fall broadcast. General Comments: Practically no rain fell during the growing season. Temperatures were above normal. Late December was very cold with no snow cover. Stripe rust attacked most varieties, but only a few were susceptible to leaf and stem rust. There was minor damage from Army Worm, but no other insect, weed or pest problems.

TABLE 31

ASIA

WEST PAKISTAN. Lyallpur. (Ayub Agricultural Research Institute) Latitude: $31^{\circ} 30' N.$ Longitude: $73^{\circ} 10' E.$ Elevation: 213 meters above sea level.
 Cooperators: Ayub Agricultural Research Institute.

Planting Date: 22 November 1968. Precipitation during test: not stated. Irrigation: 6 irrigations applied (76.2 mm each). Fertilizer: 120-80-0 Amount and type not stated.

General Comments: During the first and second week of March there was a heat shock and wind storm. Poor disease development in general. There was a Jasid and an Aphid attack.

Scoring notes taken: Days to flowering and stripe rust - 18 February, leaf rust and lodging - 8 April.

TABLE 34

ASIA

INDIA. Durgapura, (Jaipur) Rajasthan. Latitude: $26^{\circ} 51' N.$ Longitude: $75^{\circ} 47' E.$ Elevation: approximately 390 meters above sea level.
 Cooperators: Dr. S. M. Gandhi.

Planting Date: 19 November 1968. Precipitation during test: not stated. Irrigation: 7 irrigations applied. Fertilizer: 137 Kg./Ha. N as Amm. Sulphate, 50 Kg./Ha. P_2O_5 as Superphosphate.

General Comments: There was no rainfall during the experiment. High temperatures prevailed at maturity. No disease, insect, weed or pest problems.

TABLE 35

ASIA

NEPAL. Khumal, Kathmandu. Latitude: 27° 40' N. Longitude: 85° 20' E. Elevation: 1360 meters above sea level.
 Cooperators: H. B. Shrestha, R. M. Joshi and M. P. Panth.

Planting Date: 13 November 1968. Precipitation during test: 105.2 mm. Irrigation: 4 irrigations applied (flooding). Fertilizer: 90 Kg./Ha. N as Amm. Sulphate, 60 Kg./Ha. Single Superphosphate and 30 Kg./Ha. Muriate of Potash.

General Comments: The climatic conditions were favorable for the experiment. The maximum rainfall was at heading time, the second highest at maturity. Temperatures ranged between 30°C in April and 2.5°C in January. Stripe, leaf and stem rust were present, but not severe. No serious insect, weed or pest problems.

ASIA

TABLE 36

INDIA. Indore. Latitude: 23° N. Longitude: 76° E. Elevation: 600 meters above sea level.

Cooperators: Dr. Y. M. Upadhyaya.

Planting Date: 2 December 1968. Precipitation during the test: 10 mm. Irrigation: 450 mm in 6 irrigations. Fertilizer: 130 Kg./Ha. N as Urea, 60 Kg./Ha.

 P_2O_5 as Superphosphate, and 20 Kg./Ha. K as Muriate of Potash.

General Comments: Generally low temperatures with low to moderate humidity. There was 80-100% stem rust infection on susceptible varieties. Birds caused about 5% damage on late varieties.

TABLE 37

ASIA

JAPAN. Kunneppu, Tokoro-gun, Hokkaido. (Kitami Agricultural Experiment Station) Latitude: 43° 47' N. Longitude: 143° 12' E. Elevation: 196 meters above sea level. Cooperators: Shiro Okabe and Sachio Ozeki and staff.

Planting Date: 9 May 1969. Precipitation during test: 346.3 mm from 1 May to 5 September. Irrigation: none. Fertilizer: 36 Kg./Ha. N, 60 Kg./Ha. P₂O₅, 30 Kg./Ha. K₂O and 18 Kg./Ha. M_g.

General Comments: May and July were warm. The rest of the growing period was cool and wet. The heavy attack of mildew may have reduced the yield of many susceptible varieties. No rust infection was observed. No major insect, weed or pest problems.

Scoring notes taken: Mildew - 26 July, lodging - 10 to 25 August.

TABLE 38

AUSTRALIA

AUSTRALIA. Adelaide. (Waite Agricultural Research Institute) Latitude: 34° 58' S. Longitude: 138° 38' E. Elevation: 123 meters above sea level.
 Cooperators: A. J. Rathjen and J. Chigwidden.

Planting Date: 3 March 1969. Precipitation during test: not stated. Irrigation: not stated. Fertilizer: 179.2 Kg./Ha. Superphosphate and 89.6 Kg./Ha. Amm. Sulphate.

General Comments: It was cool, damp and cloudy until 26 September, then it was dry and sunny.

Scoring notes taken: Mildew - 6 September, days to flowering - 10 to 27 October.

TABLE 40

AFRICA

ETHIOPIA. Debre Zeit. Latitude: 08° 55' N. Longitude: 38° 58' E. Elevation: 1860 meters above sea level.
 Cooperators: Ato Tesfaye Tessema, Ato Zewdu Omer and Tareka Berhe.

Planting Date: 15 July 1969. Precipitation during test: 390.7 mm. Irrigation: none. Fertilizer: 60-60-0 N-P-K.

General Comments: Rain stopped at heading time and strong winds followed. Disease development was not severe, perhaps due to the low rainfall. There were some bird problems encountered, but no insect or weed problems.

TABLE 41

AFRICA

KENYA. Molo. (Grasslands Research Station) Latitude: 0° 22' S. Longitude: 35° 37' E. Elevation: 2804 meters above sea level.
 Cooperator: V. P. Patel.

Planting Date: 9 July 1969. Precipitation during test: 330.2 mm. Irrigation: none. Fertilizer: 16.8 Kg./Ha. N₂ and 67.2 Kg./Ha. P₂O₅.

General Comments: The growing season was drier than normal. Stem rust level was normal, stripe rust slightly higher and leaf rust very low. Other diseases were slight. The plot was hand weeded twice.

Scoring notes taken: Stripe and leaf rust - 7 October, stem rust - 26 October, height - 3 November, lodging - 16 December.

TABLE 42

AFRICA

KENYA. Njoro. Latitude: 0° 18' S. Longitude: 35° 50' E. Elevation: 2164 meters above sea level.

Cooperator: V. P. Patel.

Planting Date: 9 May 1969. Precipitation during test: 327 mm. Irrigation: none. Fertilizer: 16.8 Kg./Ha. N₂ and 67.2 Kg./Ha. P₂O₅.

General Comments: Climatic conditions were drier than normal. Stem and stripe rust levels were slightly below normal. Leaf rust level was a little higher. The plot was hand weeded twice.

Scoring notes taken: Stripe and leaf rust - 16 and 23 July, stem rust - 26 and 27 August, height - 5 and 6 September, lodging - 8 September, shattering - 8 September and 2 October.

TABLE 43

AFRICA

RHODESIA. Salisbury Research Station. Latitude: $17^{\circ} 48' S.$ Longitude: $31^{\circ} 05' E.$ Elevation: 1495 meters above sea level.
 Cooperator: Ian B. Edwards.

Planting Date: 20 December 1968. Precipitation during test: total 272.5 mm. Irrigation: 38.1 mm. Fertilizer: 336 Kg./Ha. Ca. Amm. Nitrate (26%N), 224 Kg./Ha. Single Superphosphate (19% P_2O_5) and 112 Kg./Ha. Muriate of Potash (60% K_2O).
General Comments: Rainfall was well distributed. Temperatures ranged between $78.5^{\circ} F$ and $60.0^{\circ} F$. Stem rust spread rapidly and became quite severe. No insect, weed or pest problems.

AFRICA

TABLE 44

REPUBLIC OF SOUTH AFRICA. Groblersdal. Latitude: 25° 2' S. Longitude: 29° E. Elevation: 948 meters above sea level.
 Cooperators: D. J. Rossouw.

Planting Date: 24 April 1969. Precipitation during test: not stated. Irrigation: 375 mm. Fertilizer: 134.4 Kg./Ha. N as Amm. Sulphate, 44.8 Kg./Ha. P as Superphosphate and 44.8 Kg./Ha. K as KCL.

General Comments: Climatic conditions were dry until just before harvest, when a severe hail storm occurred. No disease development was observed. The temperature and humidity during the winter in this area are too low for stem and leaf rust development. No insect, weed or pest problems.

TABLE 45

AFRICA

REPUBLIC OF SOUTH AFRICA. Stellenbosch. Latitude: 33° 56' S. Longitude: 18° 51' E. Elevation: 91 meters above sea level.
 Cooperators: P. du Toit and T. Paxton.

Planting Date: 4 November 1968. Precipitation during test: not stated. Irrigation: 25.4 mm each week. Fertilizer: 10 Kg./Ha. N, 5 Kg./Ha. P and 10 Kg./Ha. K.

General Comments: Experiment was planted out of season. Dry, warm summer conditions prevailed. Stem rust level was high. Disease development was good, in general. There were no insect, weed or pest problems.

Scoring notes taken: Leaf rust, stem rust and height - 10 December, lodging and shattering - 6 January, Septoria nodorum - 31 December.

TABLE 46

AFRICA

SUDAN. Khashm El Girba. (Research Substation) Latitude: 15° 08'N. Longitude: 35° 4' E. Elevation: 440 meters above sea level.
 Cooperator: Dafalla Ahmed Dafalla.

Planting Date: 16 November 1969. Precipitation during test: not stated. Irrigation: 7 to 8 irrigations applied at 12 day intervals. Fertilizer: 49 Kg./Ha. Urea.
General Comments: The winter was short with intermittent hot spells. A late outbreak of stem rust occurred. An aphid infestation was controlled by spraying Roger and Ekatin.

TABLE 50

AFRICA

NIGERIA. Gamboru, N.E. Latitude: 12° 30' N. Longitude: 14° E. Elevation: 310 meters above sea level.
 Cooperators: Ministry of Natural Resources.

Planting Date: 3 December 1968. Precipitation during test: not stated. Irrigation: 13 irrigations, 50.8 mm Delta at 7 day intervals. Fertilizer: Amm. Sulphate applied 3 times.
General Comments: Climatic conditions were very dry, with low humidity. Night temperatures low (55°F). No disease was observed. There were no insect, weed or pest problems.

TABLE 51

AFRICA

TUNISIA. Tunis. (I.N.R.A.T.) Latitude: 37°
 Cooperators: Accelerated Cereal Production Project.

Planting Date: 3 December 1968. Precipitation during test: 300 mm. Irrigation: none. Fertilizer: 100 Kg./Ha. Amm. Nitrate and 45 Kg./Ha. Superphosphate.
General Comments: Moderate temperatures with occasional wind. Some days of strong winds prior to heading and maturity. Good distribution of rainfall except during the period prior to maturity. Good development of Powdery mildew and some Septoria infection. Stripe, leaf and stem rust developed late. Birds were a problem.
Scoring notes taken: Mildew - 1 to 15 May, rusts - 1 to 15 June, Septoria - 1 to 15 June, lodging and shattering - 20 June.

TABLE 54

SOUTH AMERICA

BRAZIL. Pedras Altas, Municipio de Herval. Latitude: $31^{\circ} 40' 5''$ S. Longitude: $53^{\circ} 35'$ W. Elevation: 300 meters above sea level.
 Cooperators: Joao Moreira, Milton Medeiros and A. M. Schlehuber.

Planting Date: 2 October 1968 (very late planting). Precipitation during test: 471 mm total from July to December. Irrigation: none. Fertilizer: NPK 120-120-100 N top-dressed on October 31.

General Comments: The experiment was planted extremely late. There was below average rainfall and above average temperatures. Stem rust development was very light. There were no important insect, weed or pest problems.

TABLE 57

ARGENTINA. Paraná, E.R. Latitude: $31^{\circ} 50' S.$ Longitude: $60^{\circ} 31' W.$ Elevation: 110 meters above sea level.

Cooperators: A. L. Chabillon.

Planting Date: 27 June 1969. Precipitation during test: 683 mm total from January to December. Irrigation: none. Fertilizer: none.General Comments: Between May and October there was a severe drought. There was an accumulation of moisture before the plot was sown. Only leaf rust and stem rust were observed. No insect, weed or pest problems.Scoring notes taken: Leaf rust - 9 October, stem rust - 28 October.

TABLE 59

SOUTH AMERICA

ECUADOR. Santa Catalina. Latitude: 0° 22' S. Longitude: 78° 33' W. Elevation: 3058 meters above sea level.
 Cooperators: I.N.I.A.P. - Cereals Department.

Planting Date: 24 January 1969. Precipitation during test: 927.8 mm total from January to August. Irrigation: none. Fertilizer: 300 Kg./Ha. 10-40-10.

General Comments: Disease development was normal. No insect, weed or pest problems were observed.

Scoring notes taken: Stripe rust (leaf and head), leaf rust, stem rust and Septoria - 30 June; height - 20 August.

TABLE 60

SOUTH AMERICA

COLOMBIA. Tibaitata. Latitude: $4^{\circ} 30' S.$ Longitude: $74^{\circ} 05' W.$ Elevation: 2650 meters above sea level.
 Cooperators: Mario Zapata, Daniel Vasela, R. Lopez and Obed Ramirez.

Planting Date: 9 November 1968. Precipitation during test: not stated. Irrigation: not stated. Fertilizer: 250 Kg./Ha. 10-30-10.

General Comments: During the growing season there were severe frosts, which severely reduced some of the yields.

Scoring notes taken: Stripe rust (leaf) - 12 December, stripe rust (head) - 15 January, days to maturity - 28 February, stem rust - 6 March, root rot - 10 March.

TABLE 61

MESOAMERICA

GUATEMALA. Labor Ovalle. Latitude: $14^{\circ} 52' N.$ Longitude: $91^{\circ} 33' 14'' W.$ Elevation: 2380 meters above sea level.
 Cooperators: Ing. Astolfo Fumagalli and Salvador Cruz.

Planting Date: 15 June 1969. Precipitation during test: 795 mm. Irrigation: not stated. Fertilizer: 127-79 Kg./Ha. Nitrogen-Phosphate.

General Comments: There was a very good Septoria tritici infection. No insect, weed or pest problems.

Scoring notes taken: Stripe and leaf rust - 8 September, stem rust and Septoria sp. - 9 September, height and lodging - 20 September, Septoria tritici - 3 November, days to maturity - 10 November, shattering - 17 November.

TABLE 63

MESOAMERICA

MEXICO. Roque, Guanajuato. (CIAB) Latitude: 20° 32' N. Longitude: 10° 49' W. Elevation: 1765 meters above sea level.
 Cooperators: Ing. Ricardo Urbina Amador and Ing. Felix Ramirez.

Planting Date: 27 December 1968. Precipitation during test: not stated. Irrigation: none. Fertilizer: 160-60-0.

General Comments: There was not enough rain at certain times during the growing season. Experiment should have been given more fertilizer and more water. The climatic conditions were not favorable for disease development.

TABLE 64

Means over all locations for yield, agronomic and disease data for the Fifth International Spring Wheat Yield Nursery (1968-1969). The means presented represent only those locations reporting that variable. Average rust values are numerically converted and transformed means where 1.0 is no disease and 10.0 represents 99S reaction. (See text for further explanation).
