

# Harnessing Genomics Outputs for Accelerating Genetic Gains: The CIMMYT Global Wheat Program

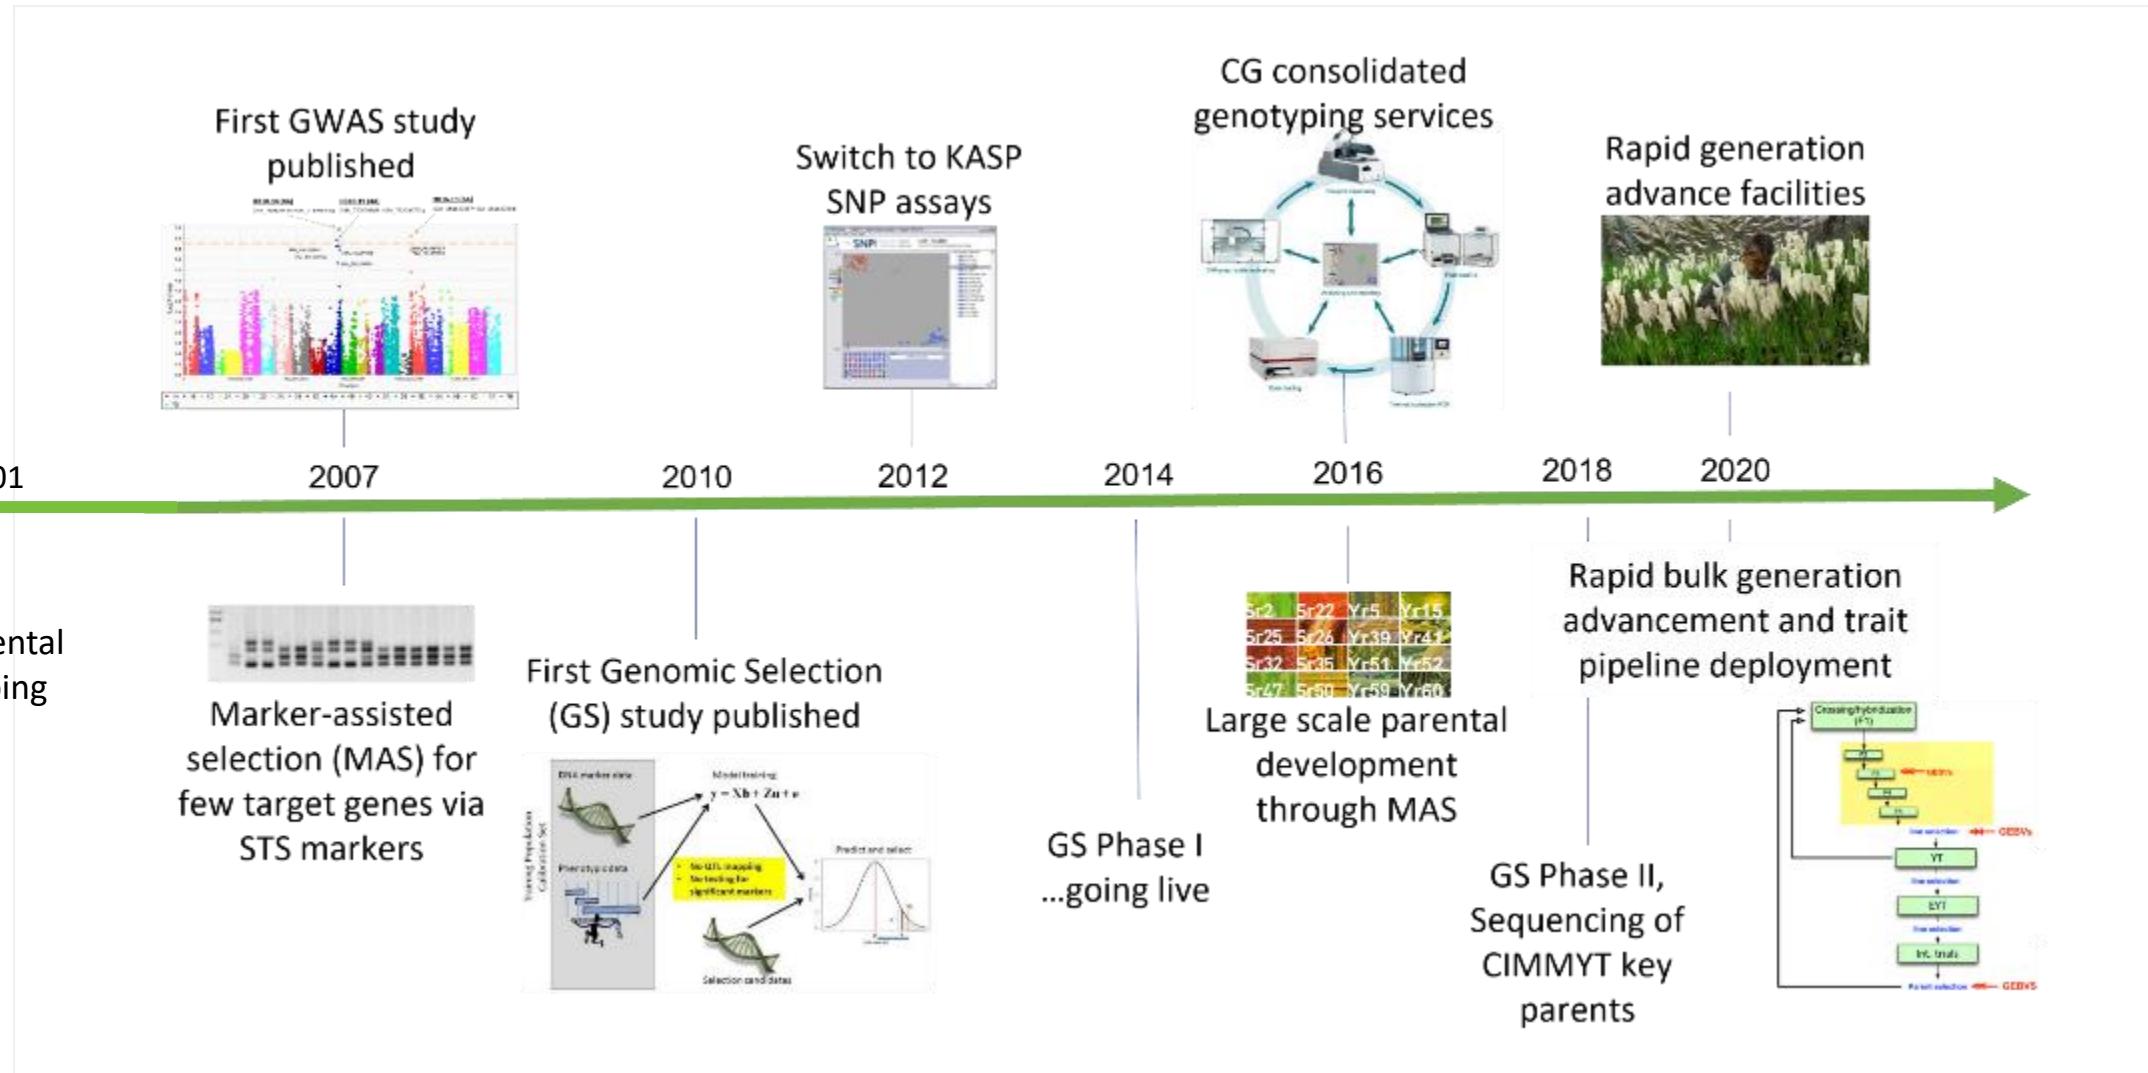

Susanne Dreisigacker, Matthew Reynolds & the CIMMYT Global Wheat Program

# Multidiscipline - Wheat Breeding

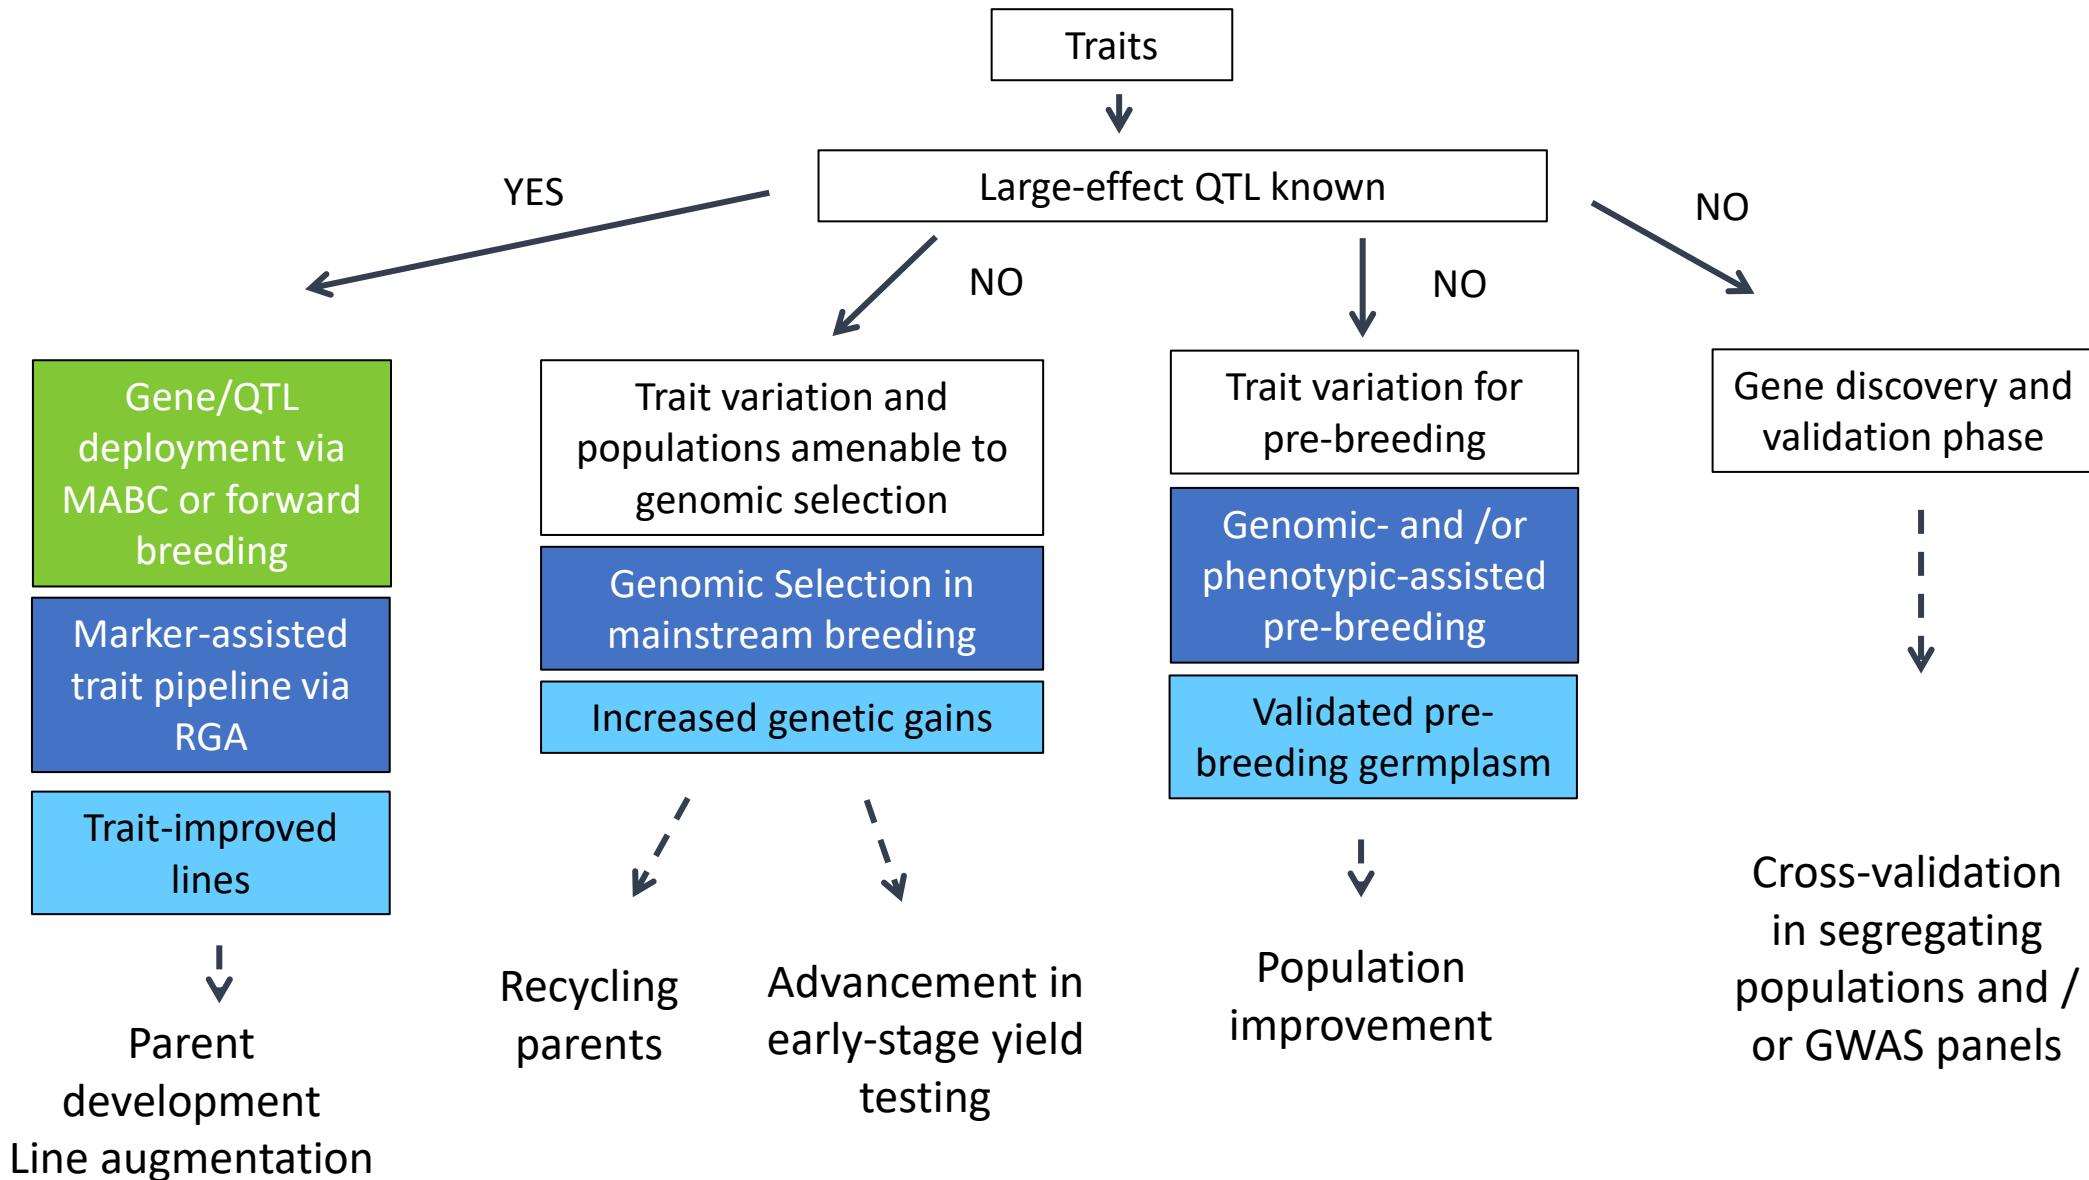

# Integration of genomics tools in the CIMMYT GWP

# How to funnel genomics outputs into breeding improvements?

## Genomics-assisted test designs and deployment strategies

# Genomics-assisted trait development pipelines

## Germplasm improvement stream (diseases, nutritional traits, physiology)

### Hypothesis and objectives

#### Line augmentation

Variant deployment, product development

#### Parent development

Marker design variant introgression

#### Discovery

New donors, new genetic variants

Running parent development pipelines

Grain yield

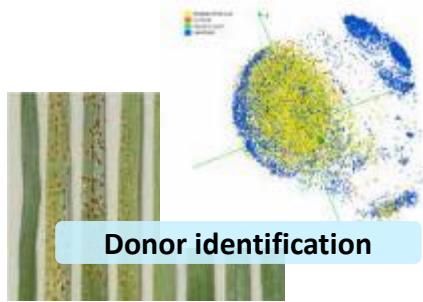

Heat and drought tolerance

Yield components

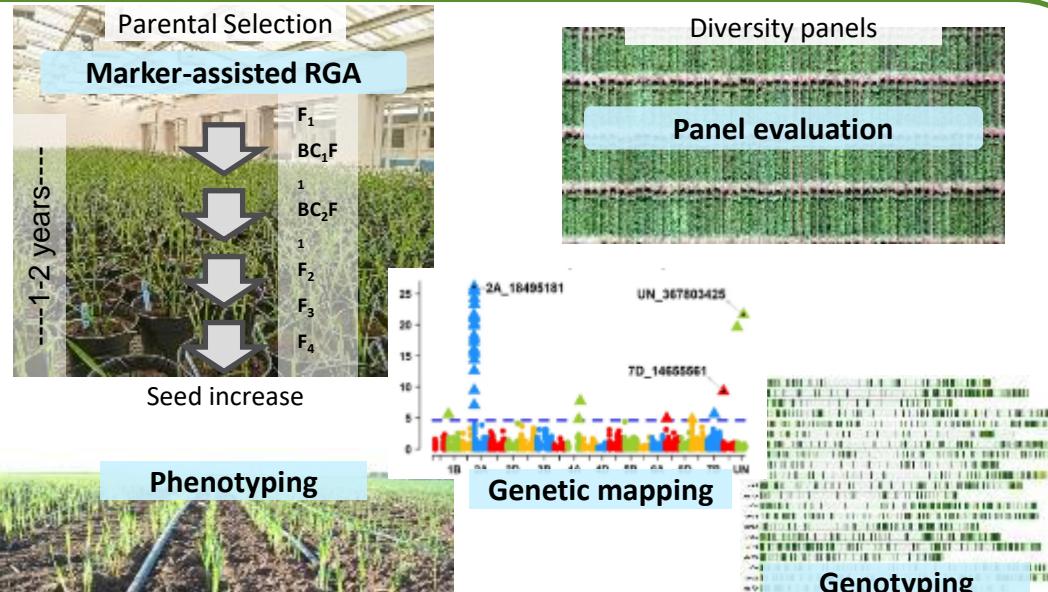

Trait-pipeline Advancement Committee

### Trait-pipeline activities toolkit

#### Donor identification

Running line augmentation pipelines

Stem rust

Yellow rust

Fusarium head blight

Septoria tritici blotch

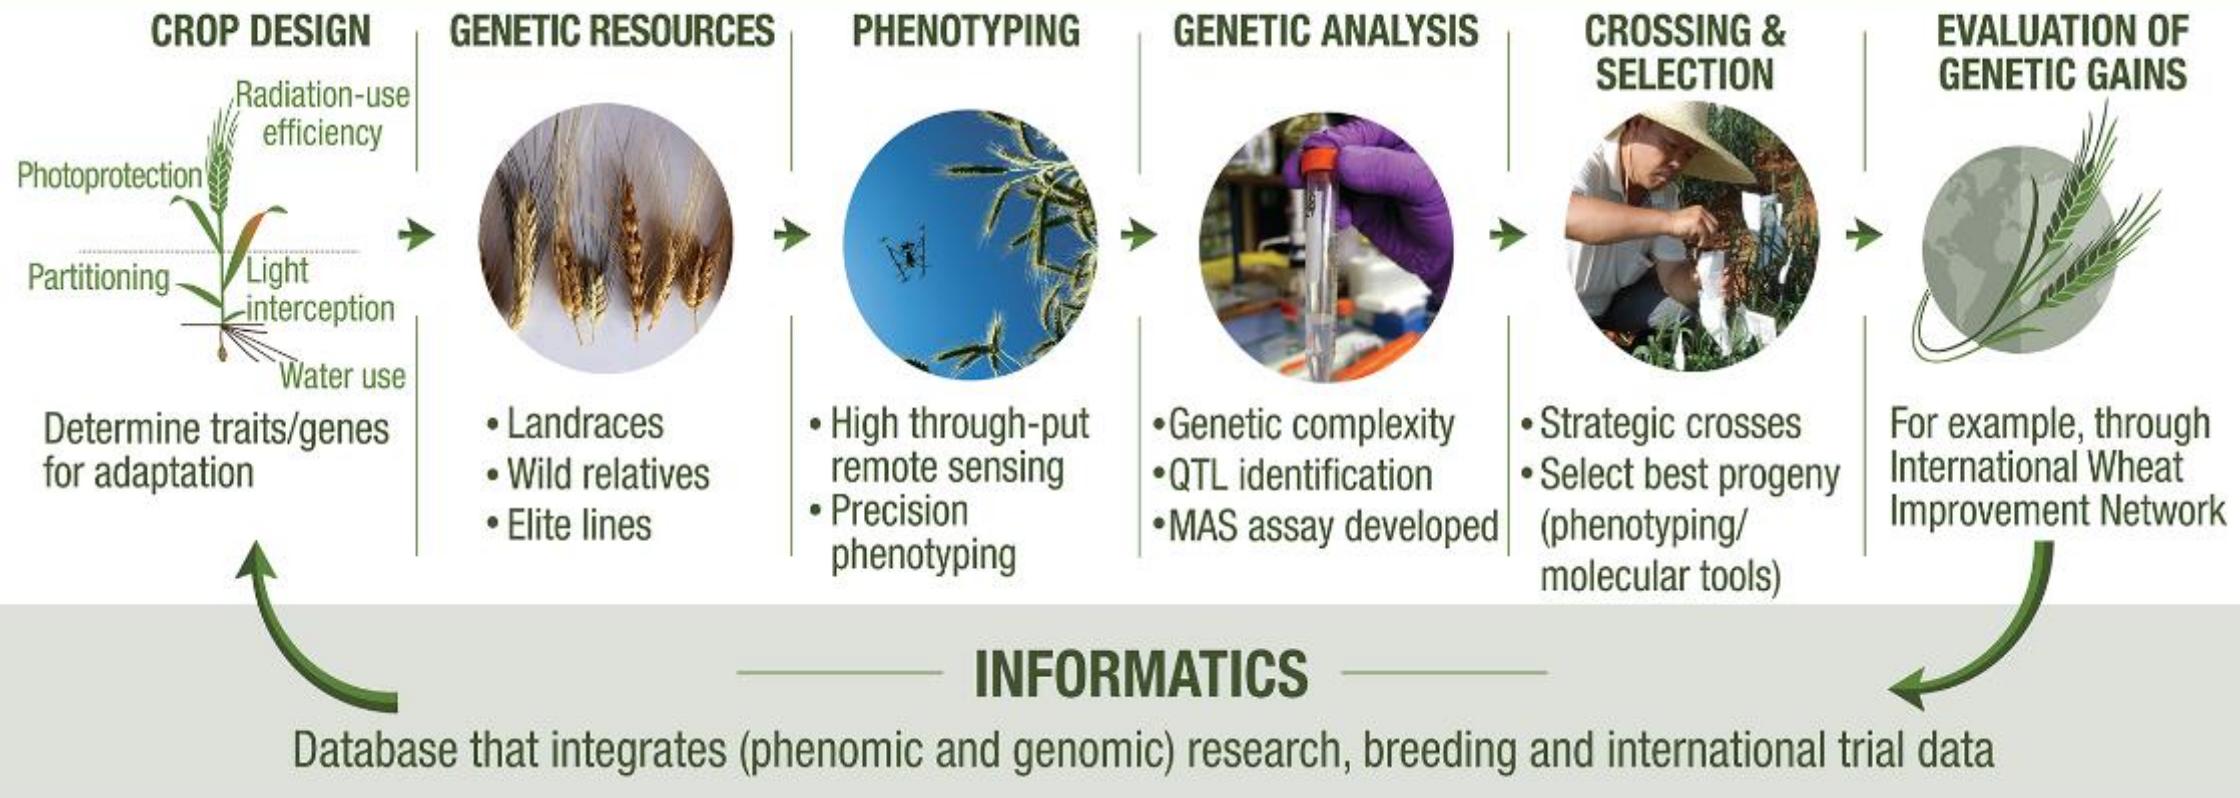

Insect resistance (greenbug)

Grain weight

Support Services: New data base structures, genotyping, decision support tools

# Translational research & pre-breeding for complex traits

## PHYSIOLOGICAL PRE-BREEDING PIPELINE

# Evaluation of new sources for stress tolerance or yield potential

## Bread wheat diversity panel (370)

Includes best performing lines from:

- International nurseries
- Derivatives from landraces/FIGS panels
- Lines derived from inter-specific hybridization

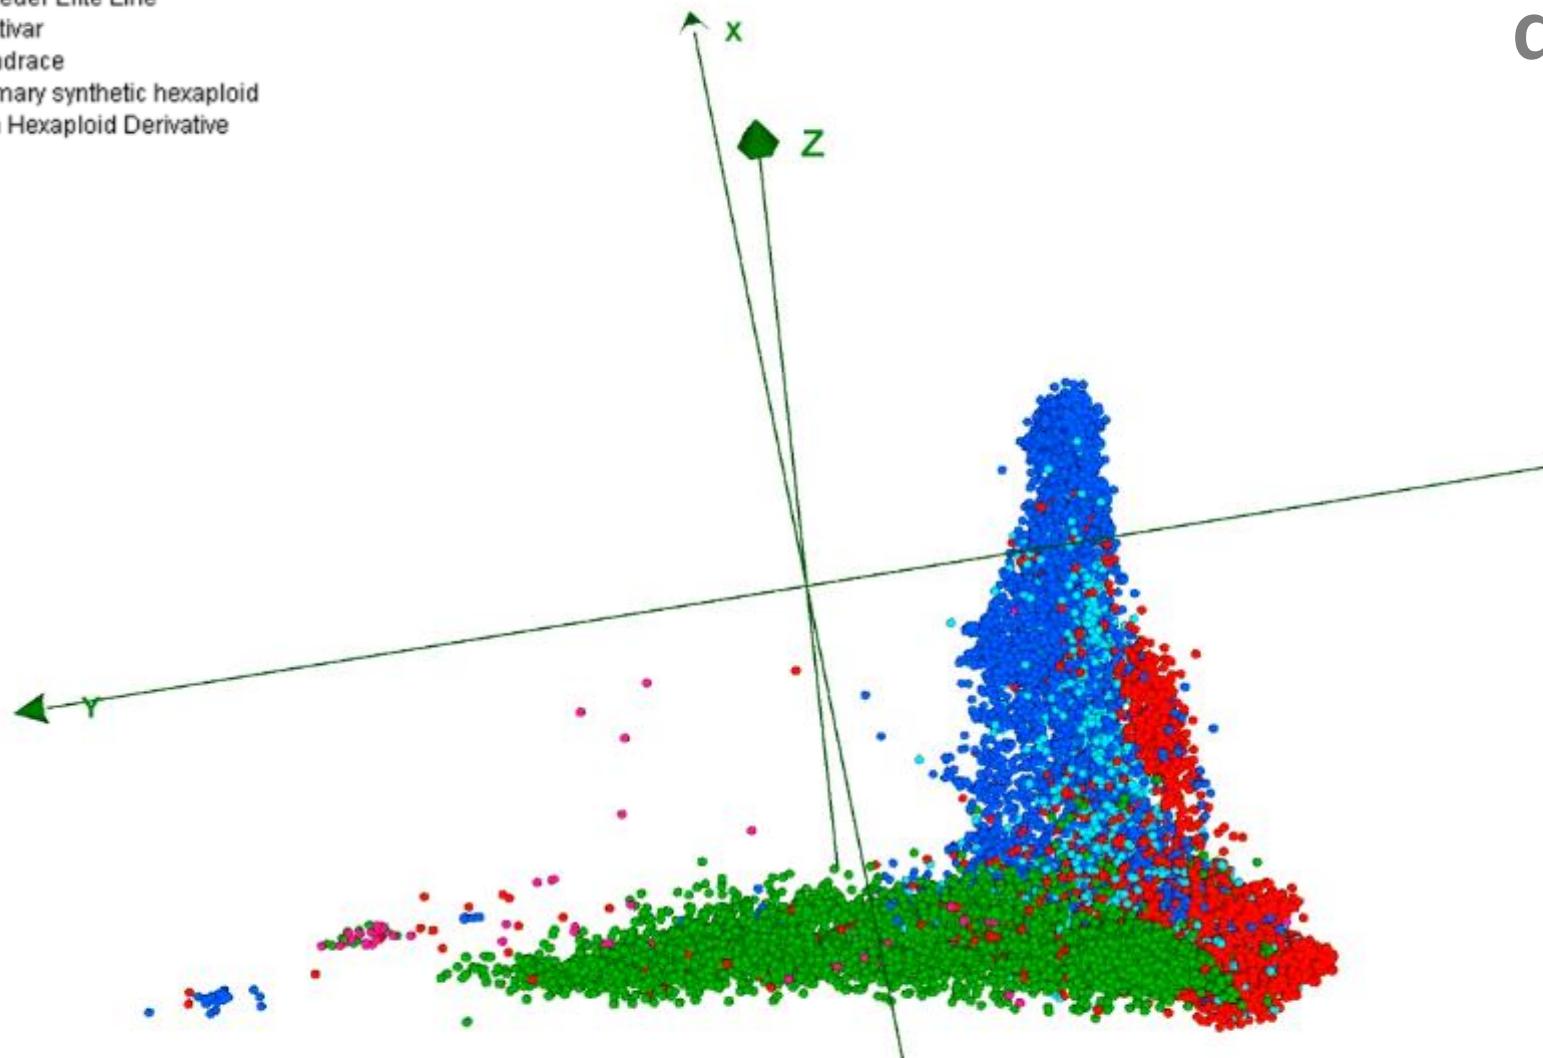

## Elite primary synthetic panel (160)

Selected from 2,000 lines (i.e. with brand new hexaploid genomes) for adaptation to heat, drought and favorable conditions

# DNA fingerprinting for diversity subsets

- Breeder Elite Line
- Cultivar
- Landrace
- Primary synthetic hexaploid
- Syn Hexaploid Derivative

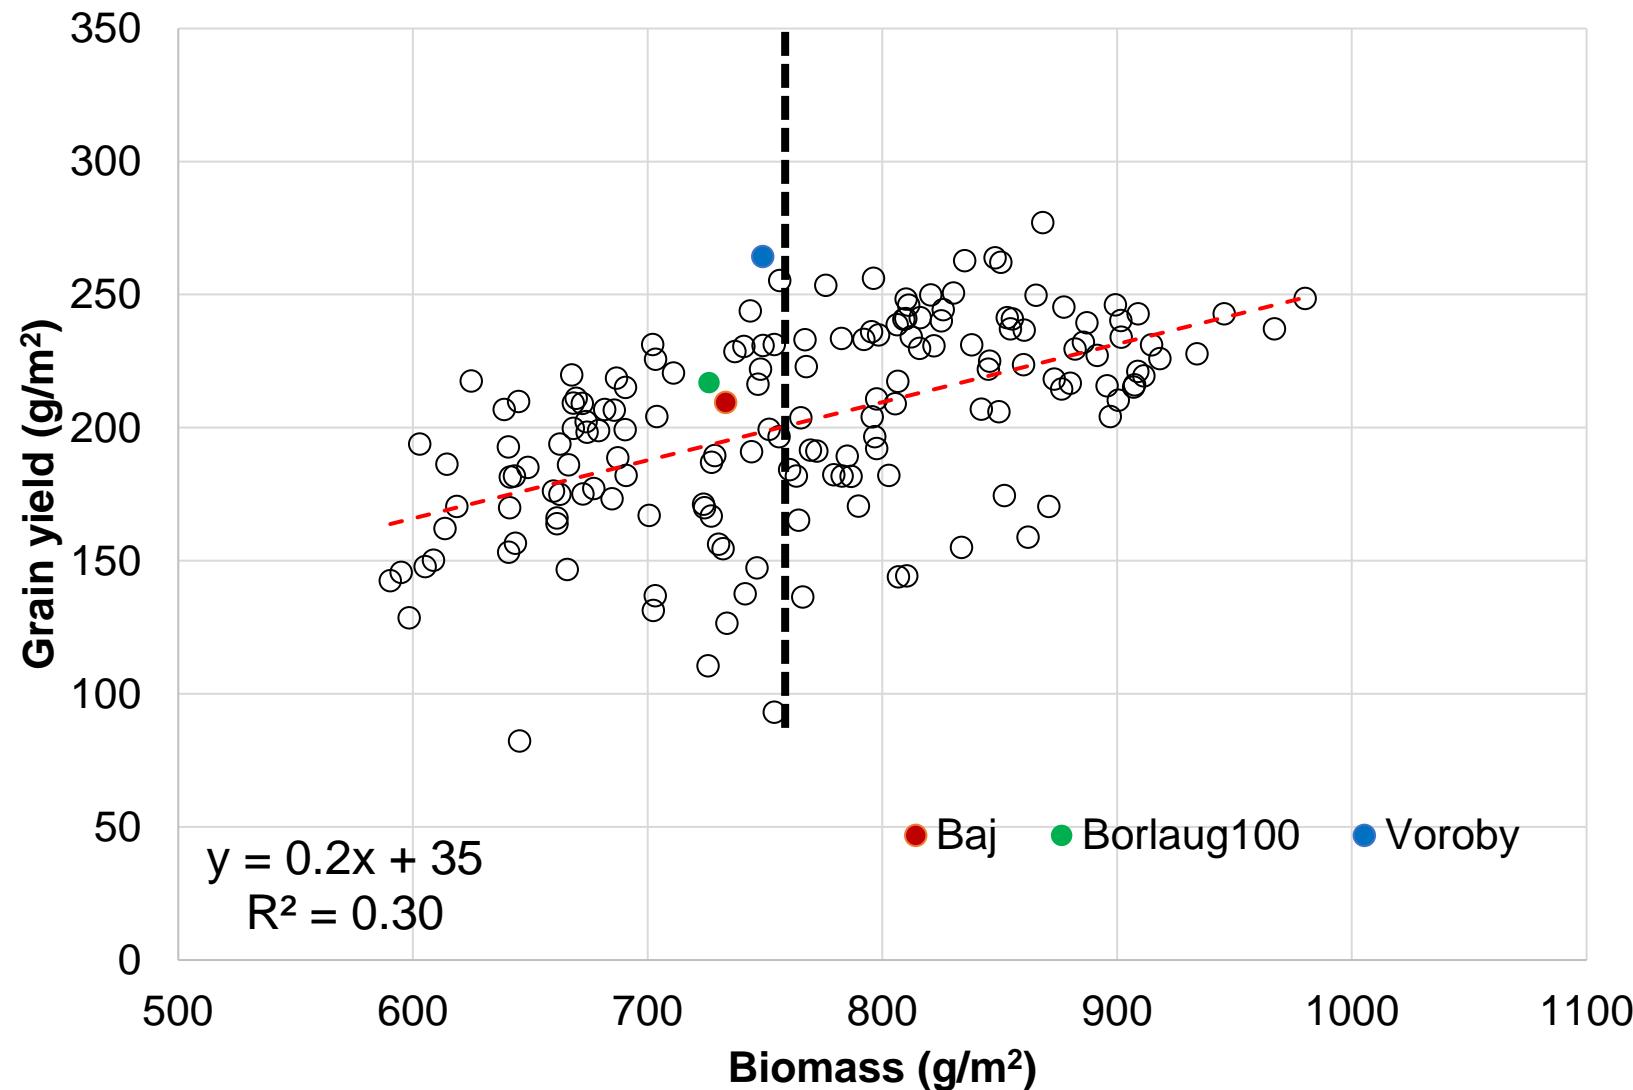

Modified Roger distance of 60,000 hexaploid accessions displayed in a multidimensional scaling plot.

## Hexaploid diversity

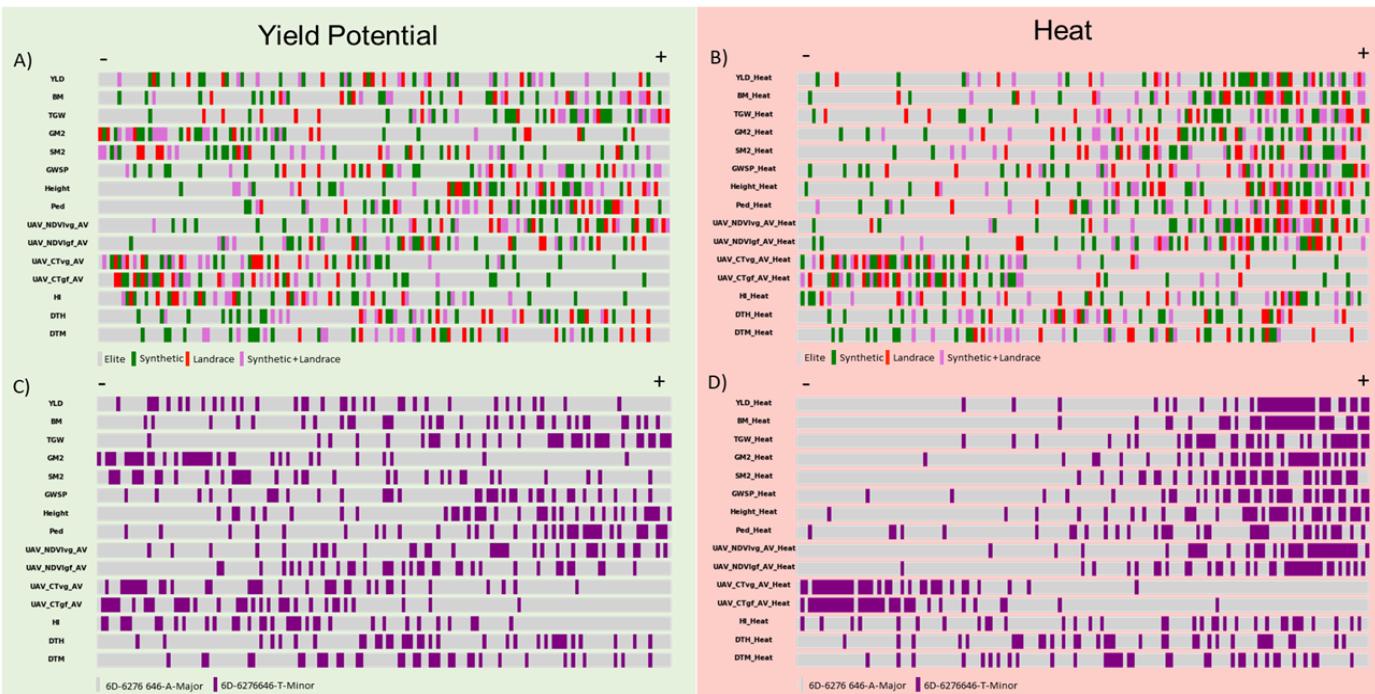

**60,000** accessions,  
**8** domesticated species:  
*T. aestivum* subs. *aestivum*,  
*T. aestivum* subs. *spelta*,  
*T. aestivum* subs. *campactum*,  
*T. aestivum* subs. *sphaerococcum*,  
*T. aestivum* subs. *macha*,  
*Triticum* hybrid,  
x *Aegilopeltiticum*  
x *Triticosecale*  
**ABD** genomes,  
**105** countries  
**26,500** SilicoDArT  
**85,500** SNP's

# Genetic variation in synthetic hexaploid wheat (heat stress)

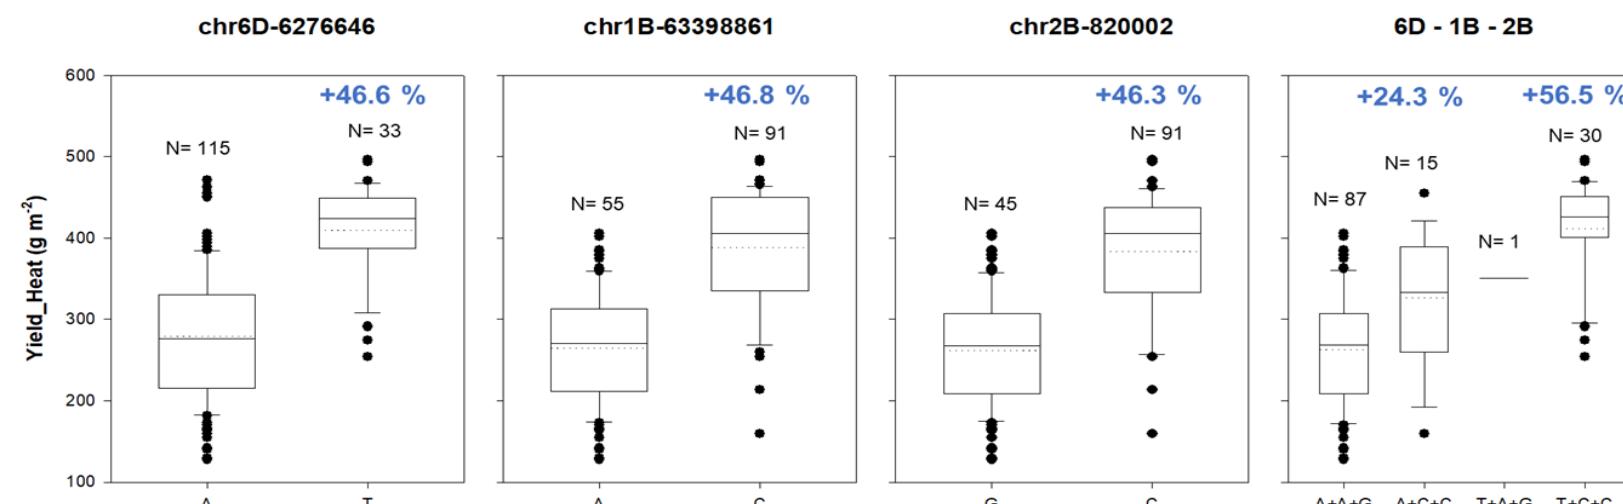

## NW Mexico, 2016 & 2017

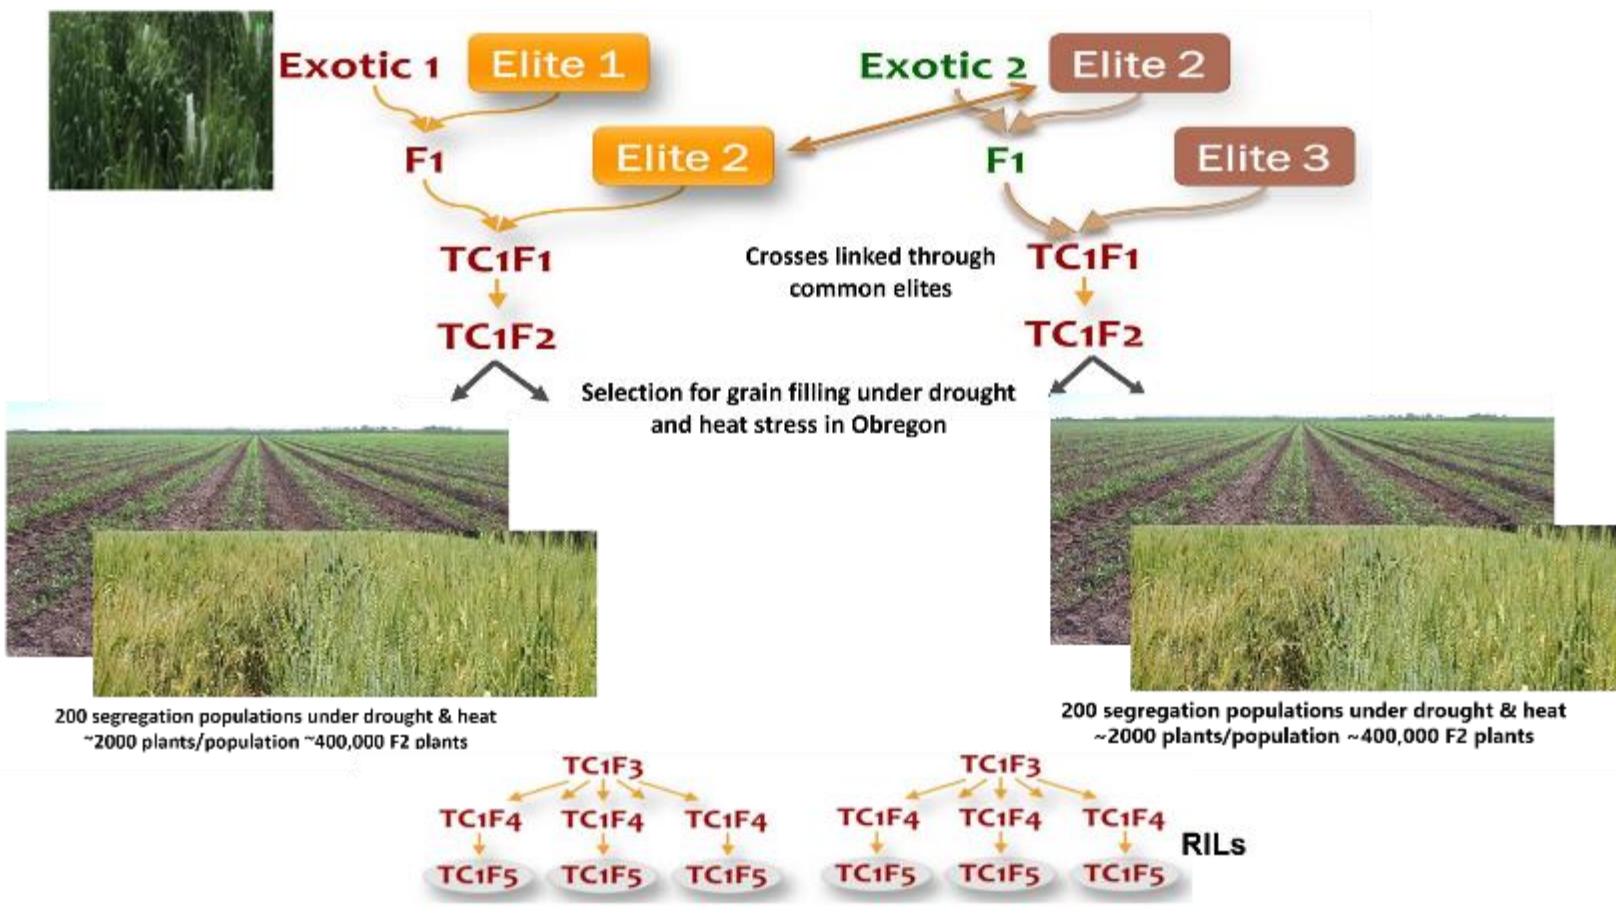

# Identification of genomic regions derived from novel sources

- Selected genetic resources (Synthetic hexaploid wheat and landrace) performed better under heat in the High Biomass Association Panel (HIBAP, 150 entires)
- Exome capture sequencing identified three QTL with large effect for heat tolerance, likely derived form genetic resources

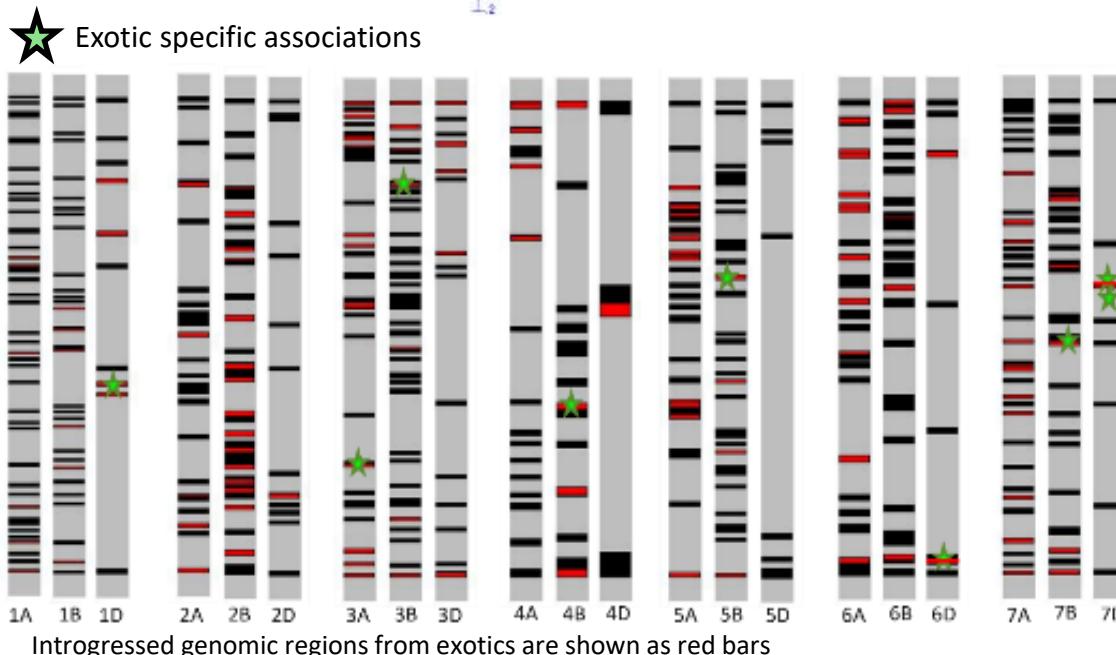

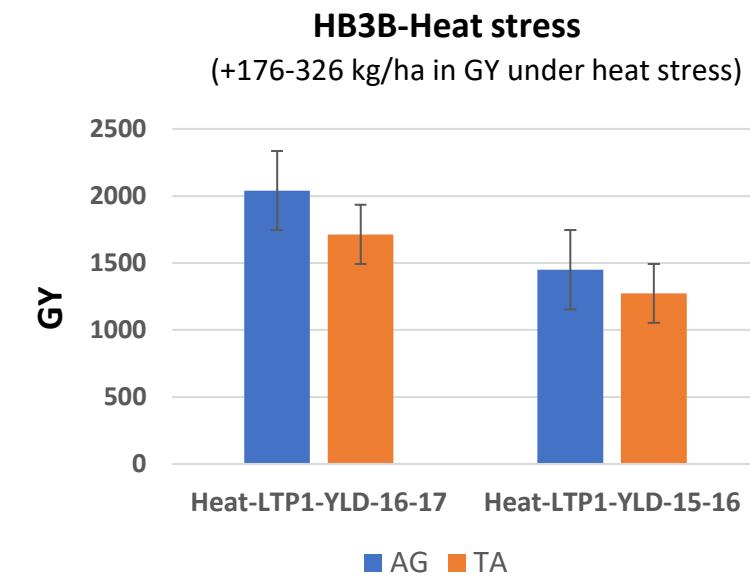

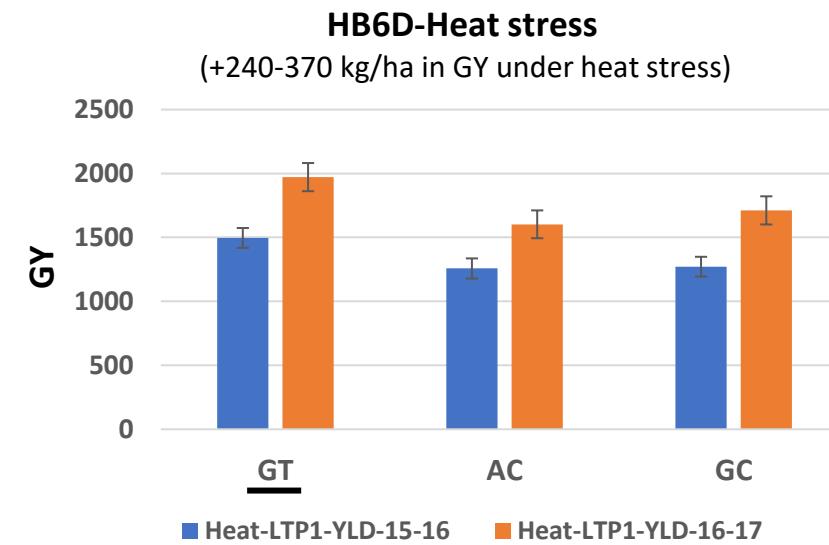

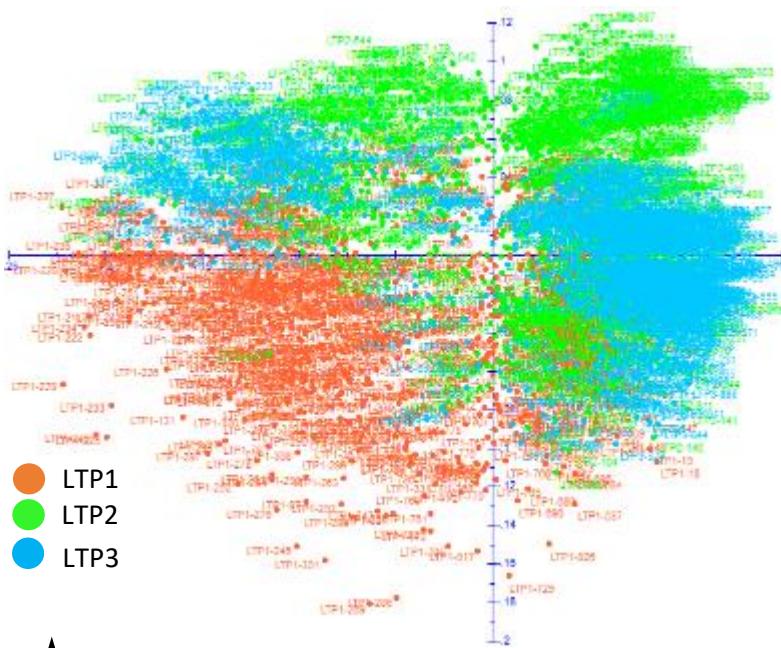

# Identification of genomic regions derived from novel sources

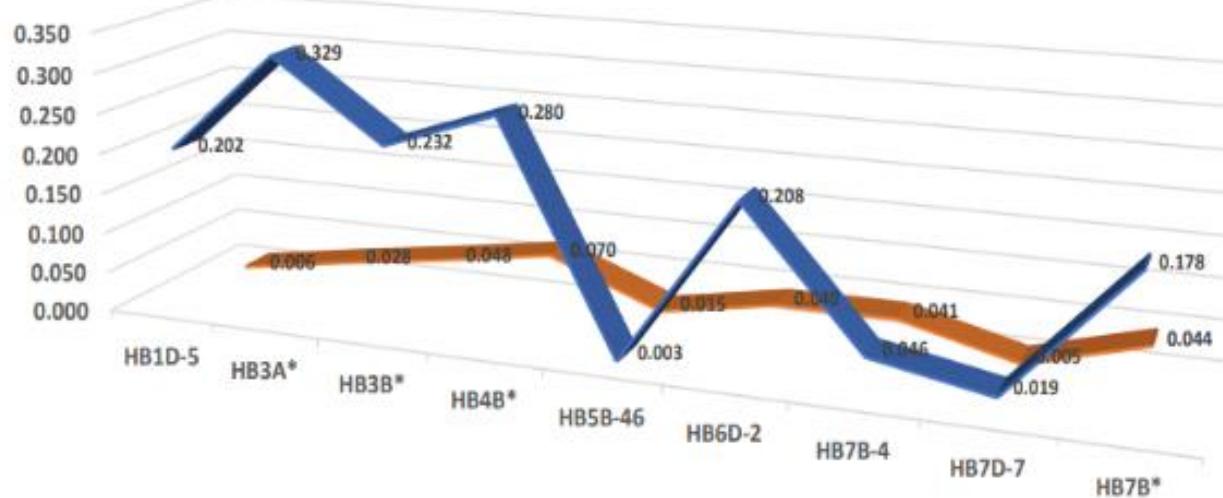

- Three-way crossing scheme of linked top-cross populations (LTP) in the Seed of Discovery project
- Exotic parents include synthetic hexaploid and landraces selected via FIGS
- Elite parent include lines from the spring BW breeding program

# Quantification of the contribution of the exotic parents in LTPs

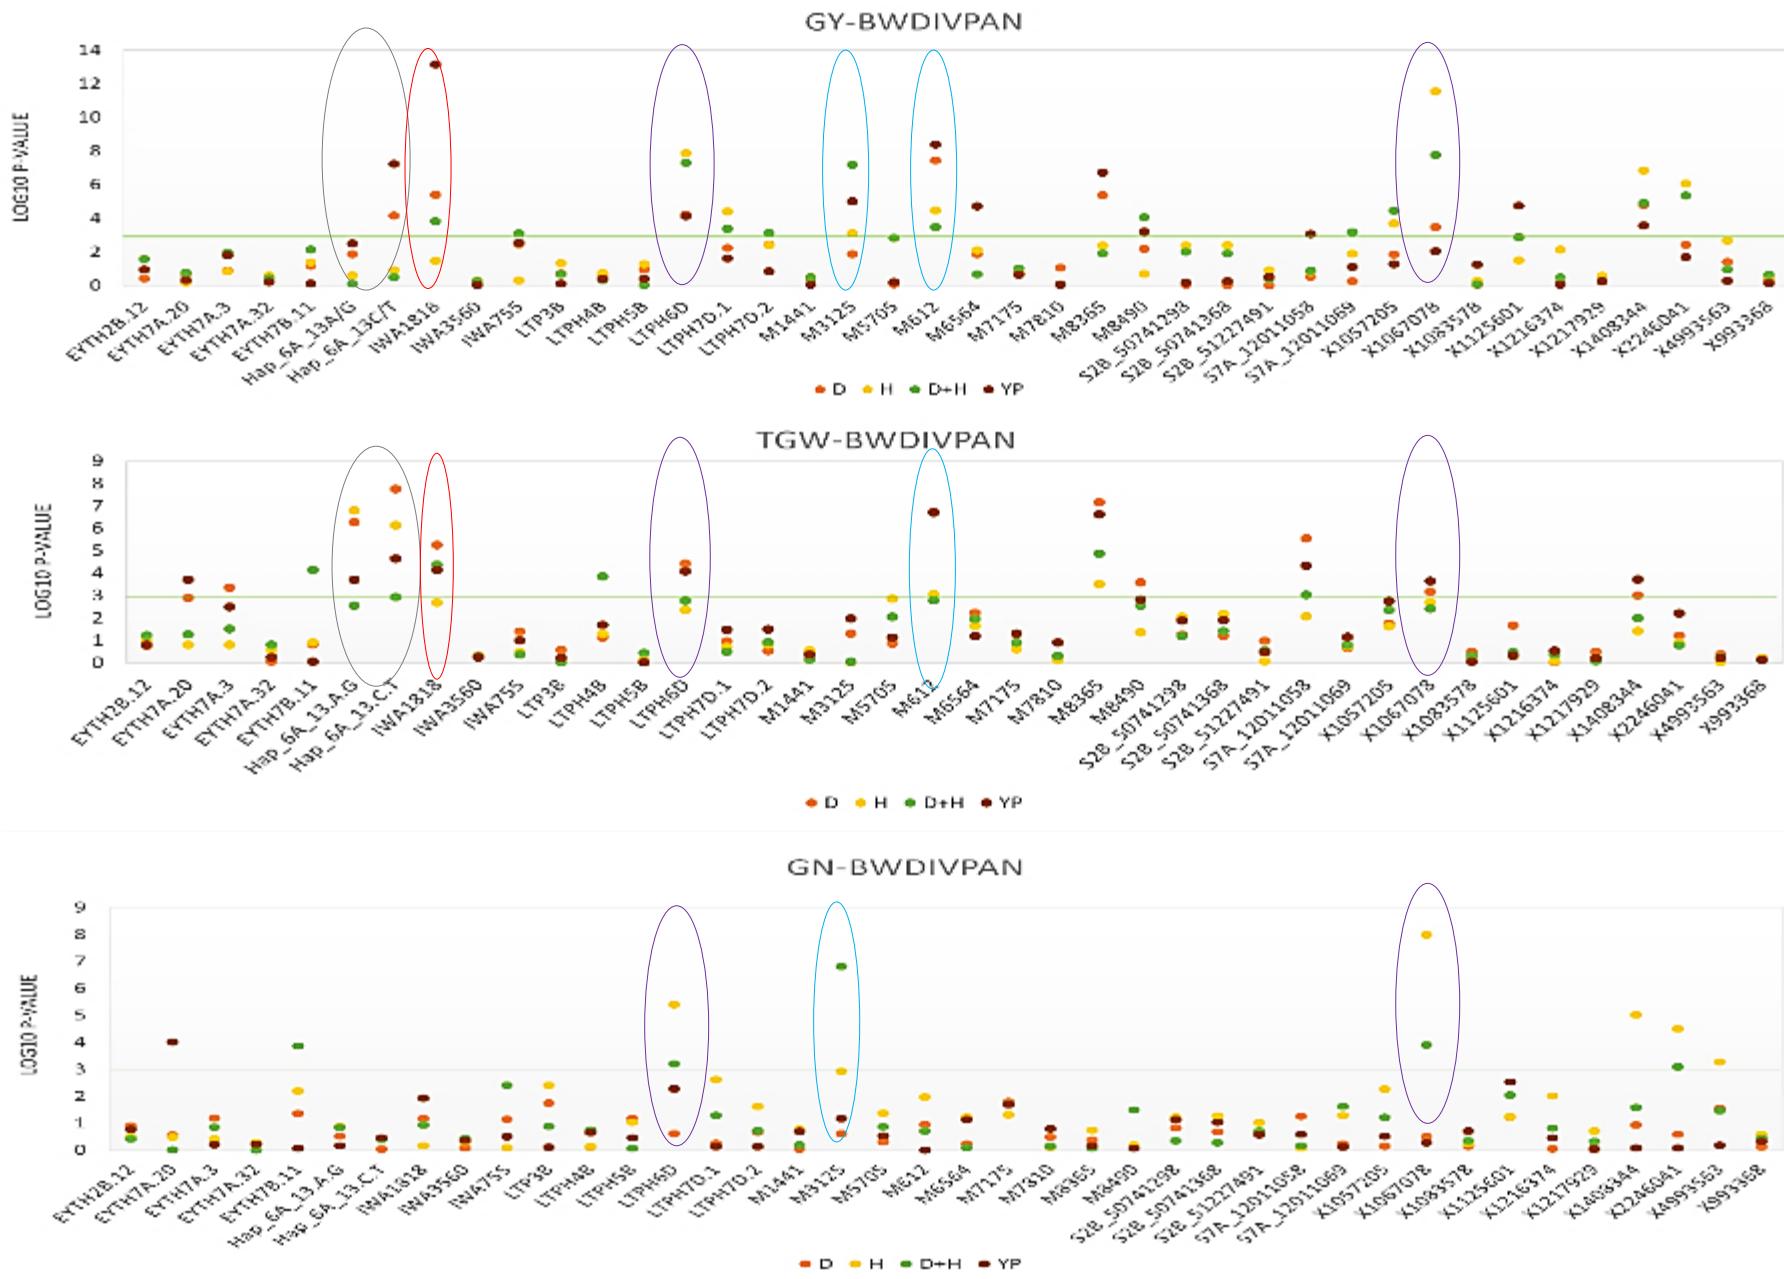

Haplotype frequencies in ■ exotic parents and ■ 16K genebank accessions

Introgressed genomic regions from exotics are shown as red bars

# QTL validation across germplasm panels (e.g., BWDIVPAN)

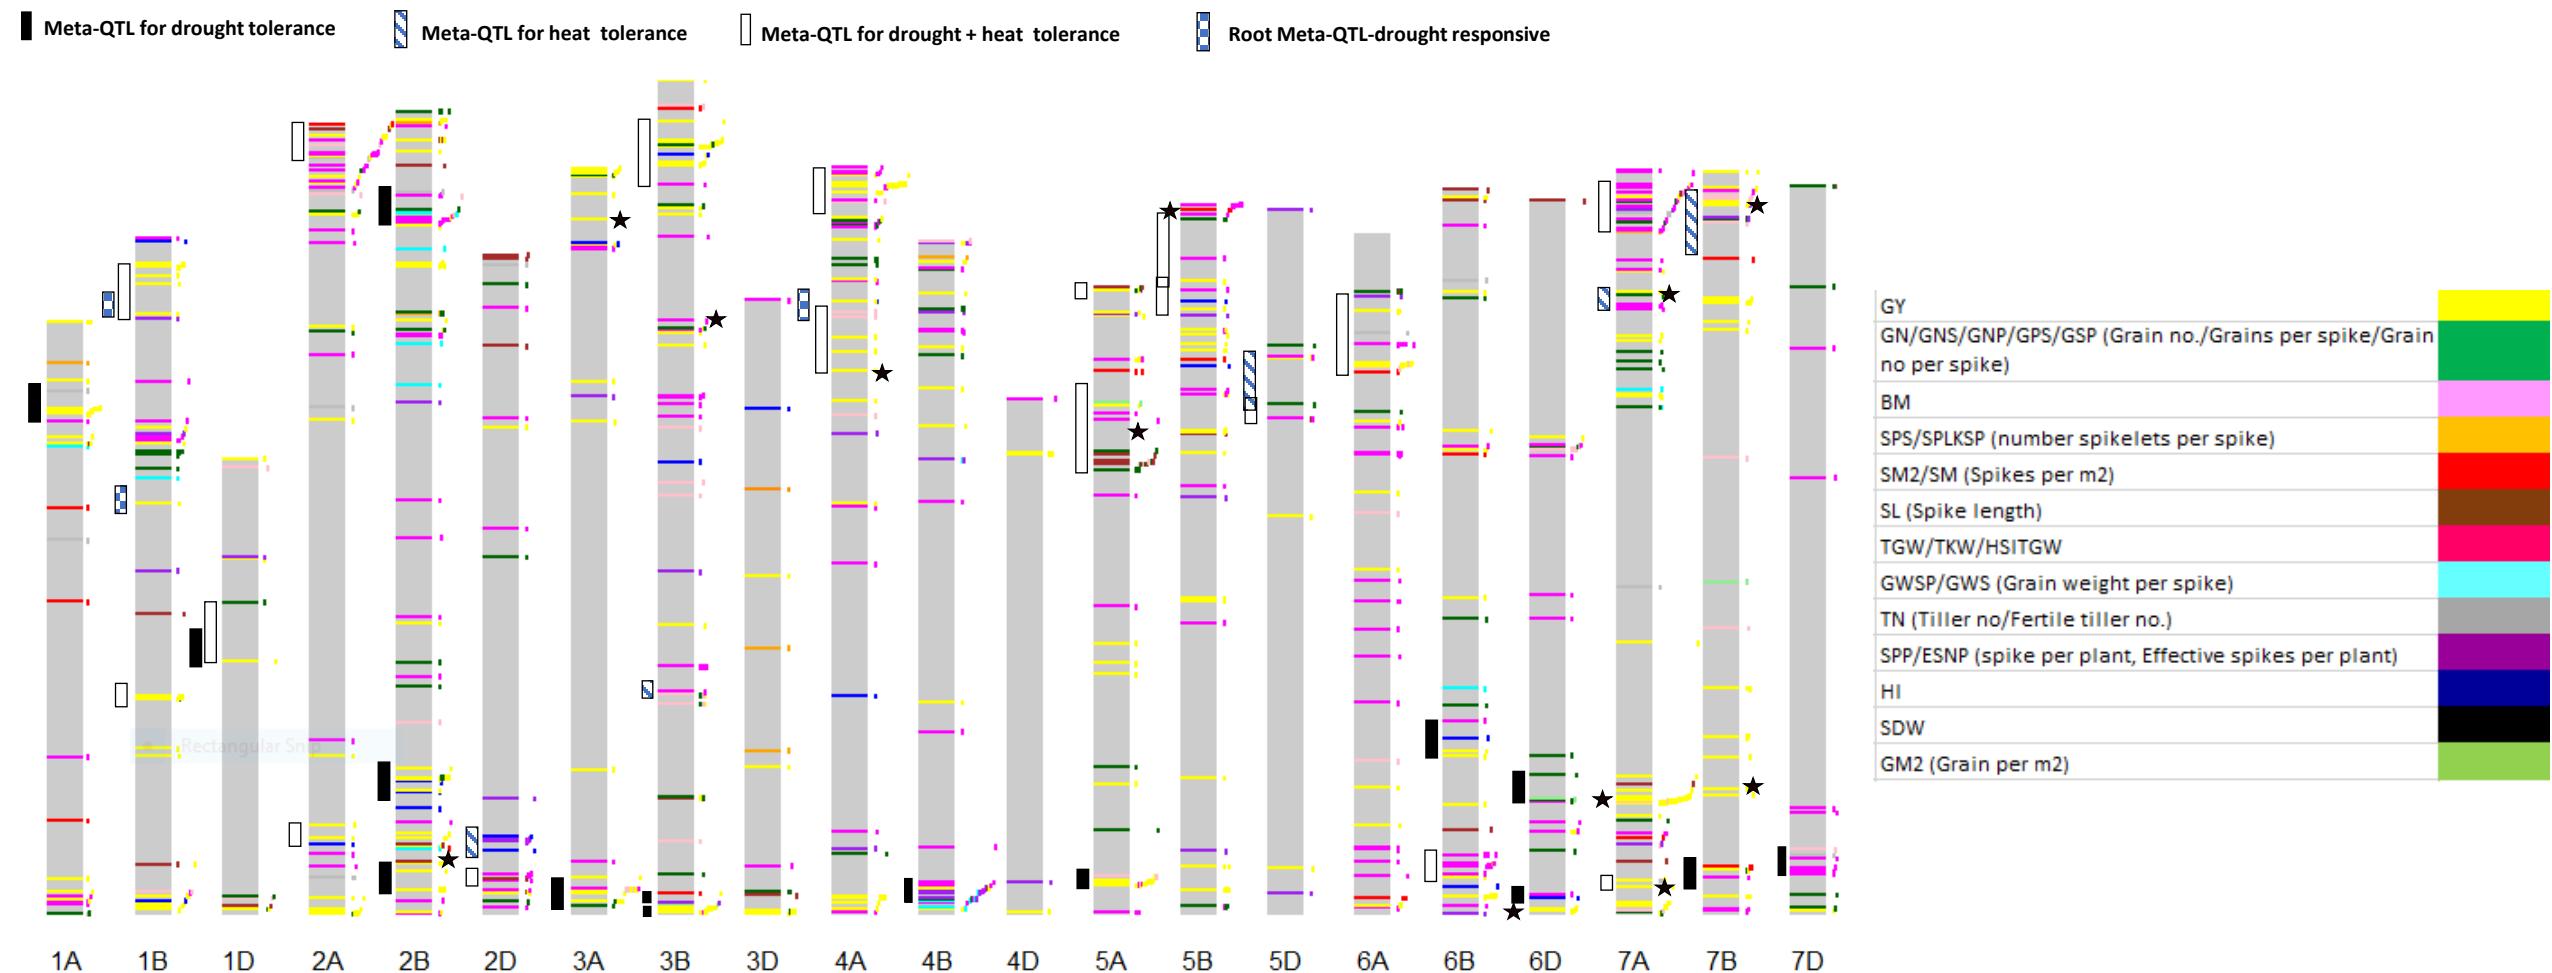

# Cycles of rapid generation advance in screen- and greenhouses

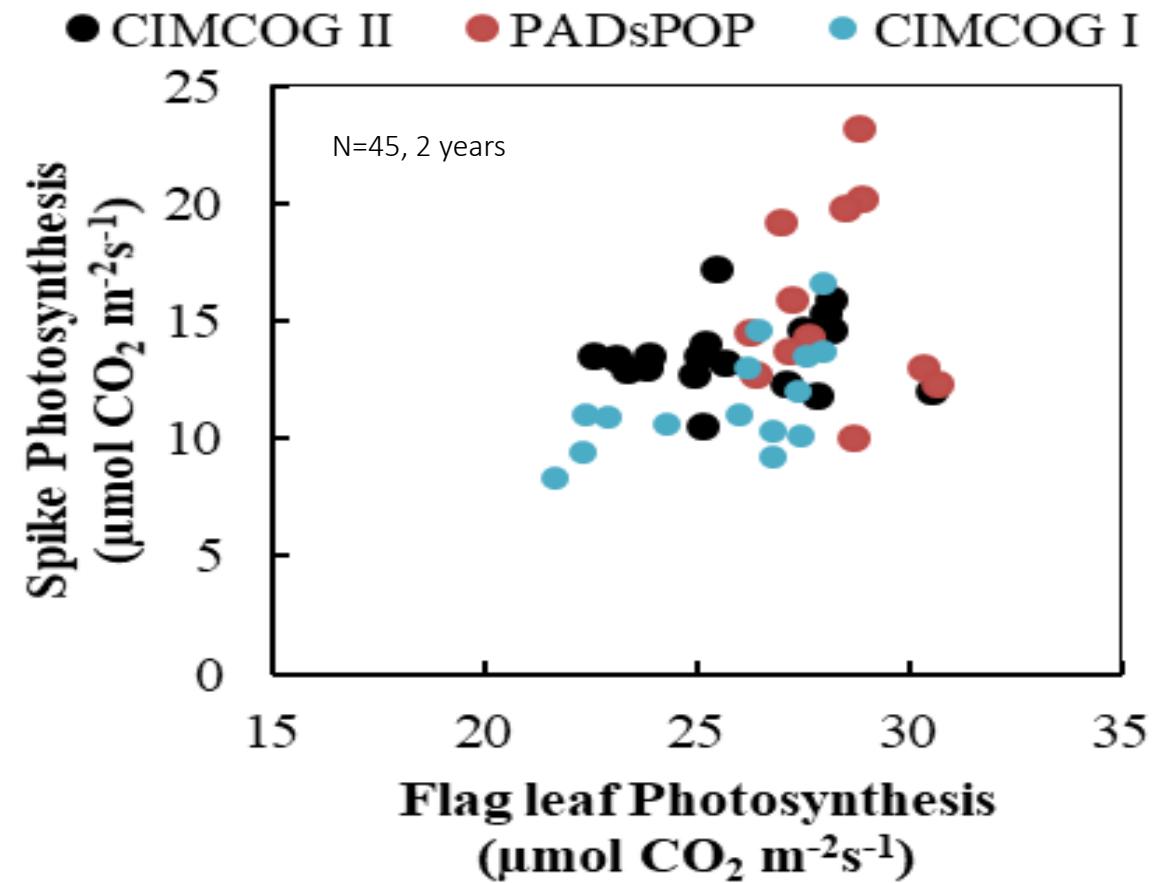

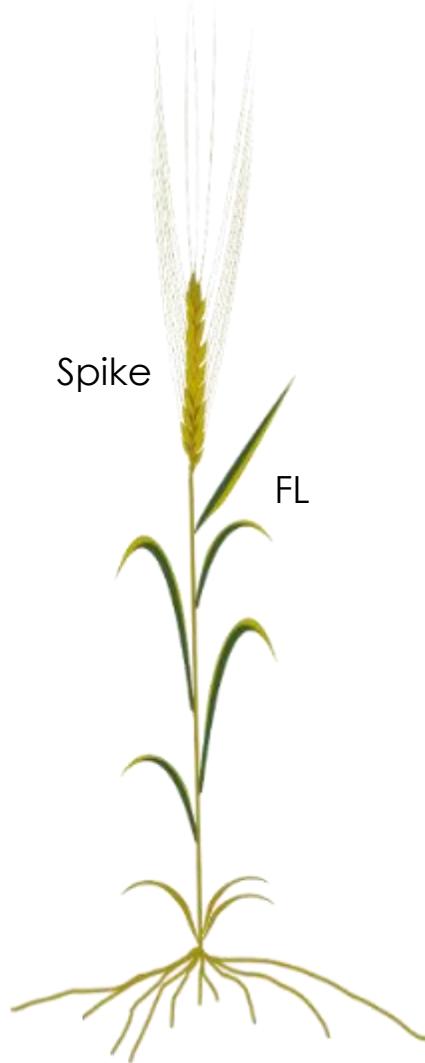

Rapid generation advance facilities in Toluca led by Suchismita Mondal

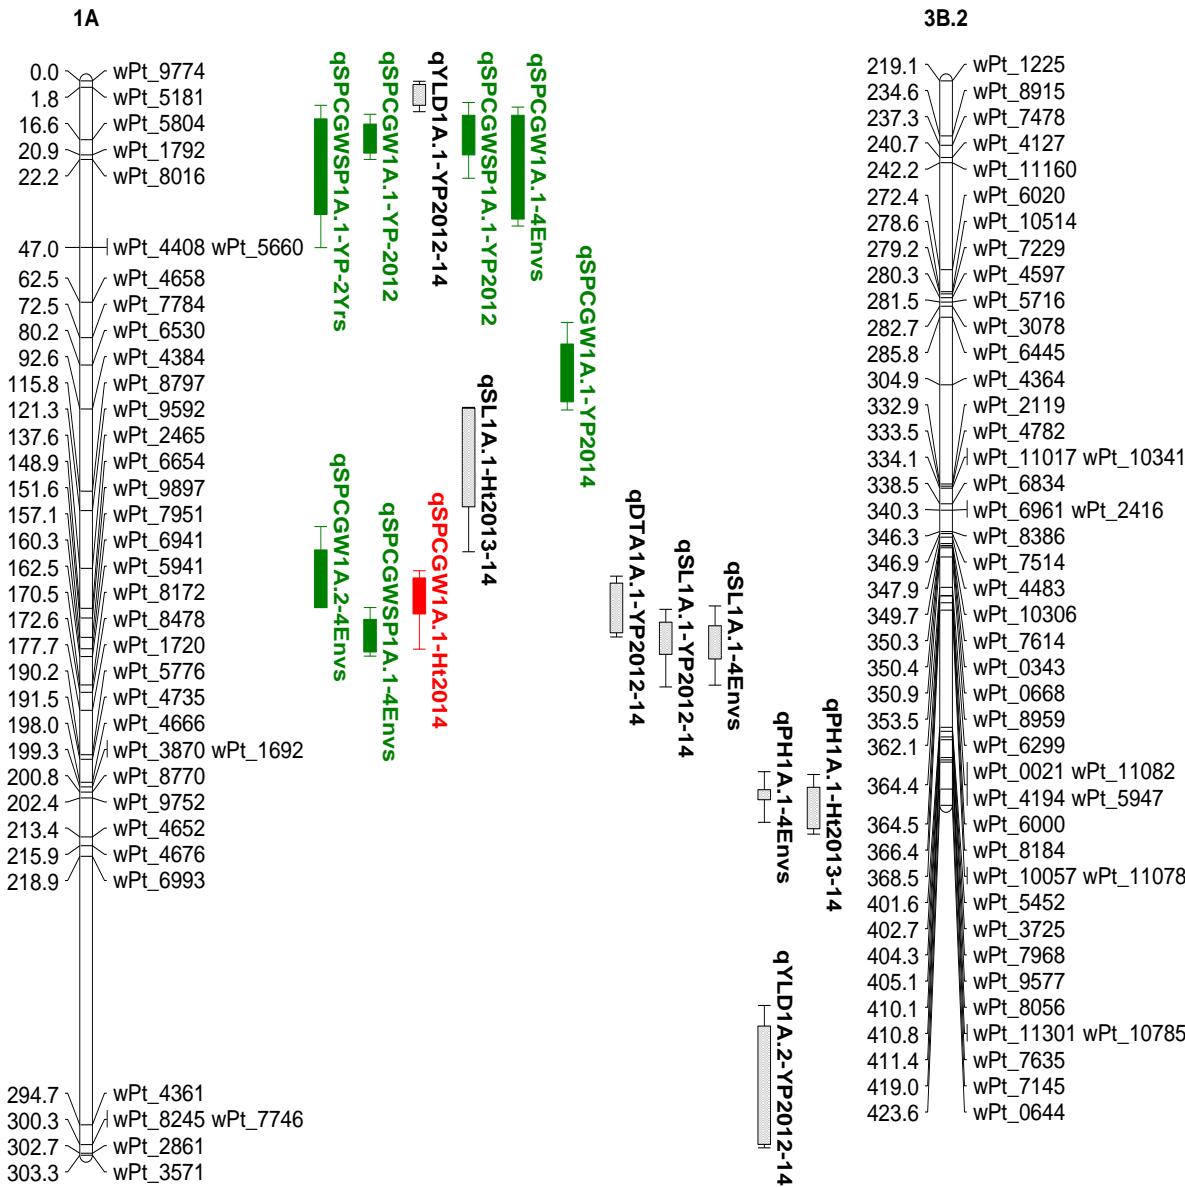

# Summary catalogue for the identification of MetaQTL

# New traits - Spike photosynthesis, not linked to leaf photosynthesis

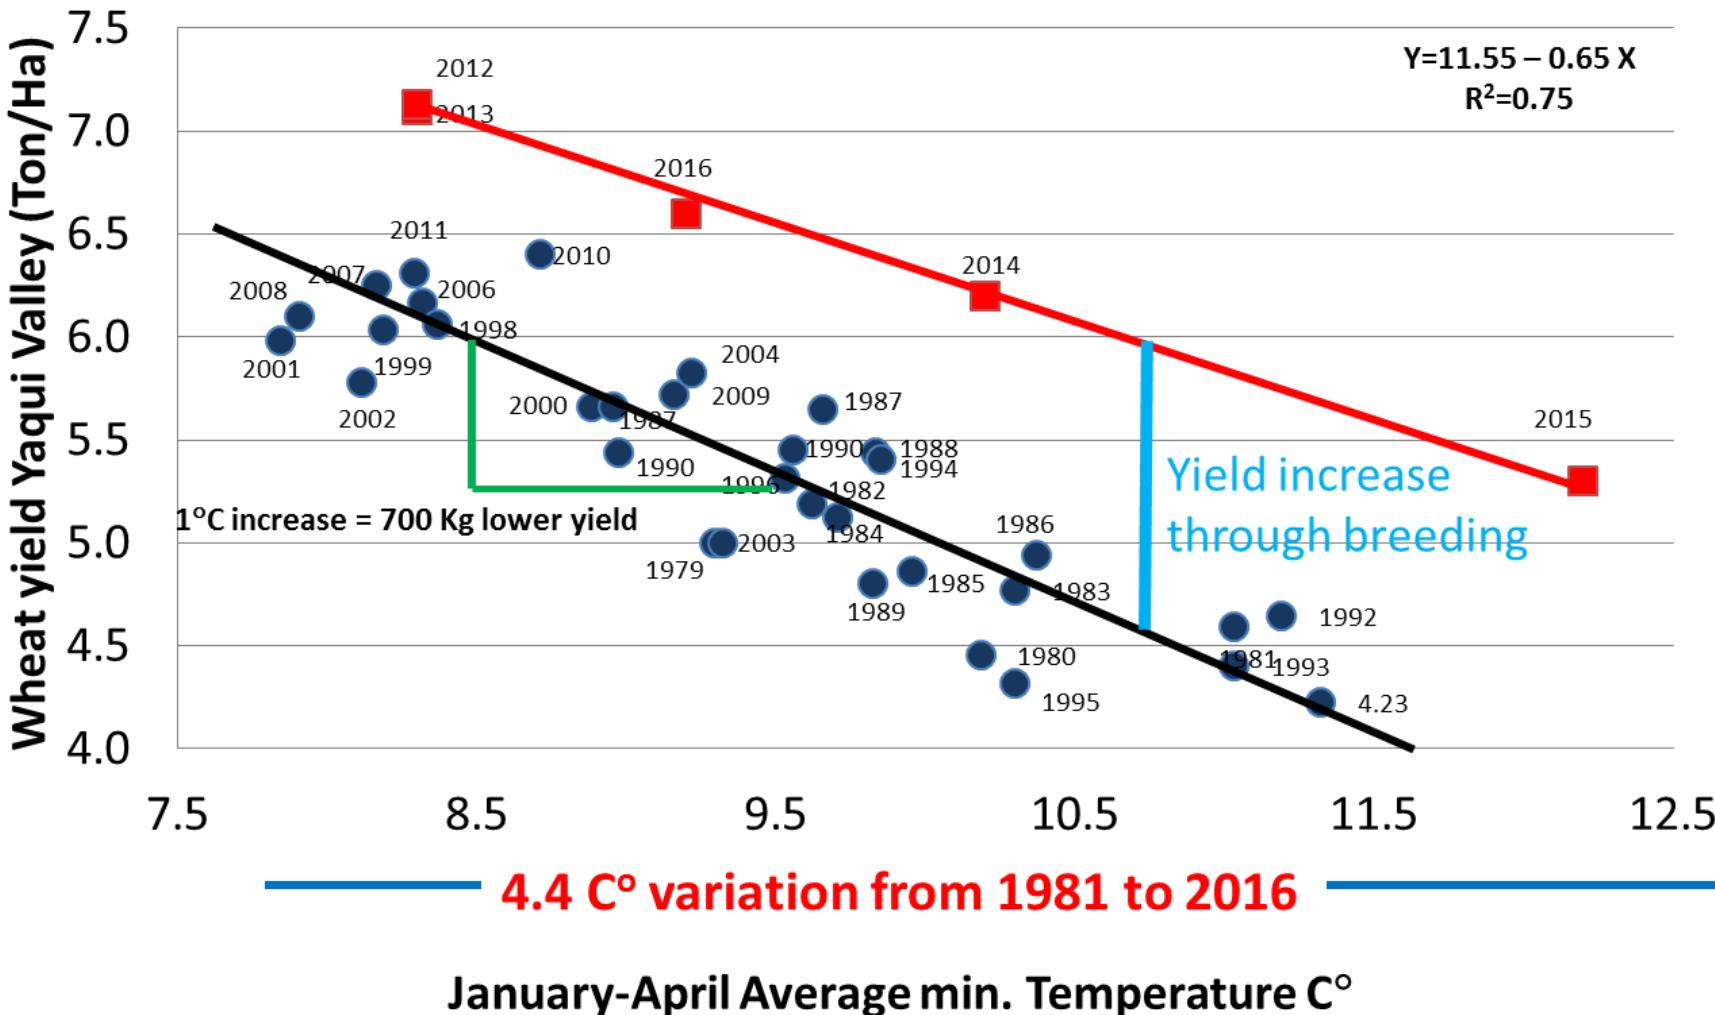

# Identifying QTL for spike photosynthesis contribution under yield potential and heat stress

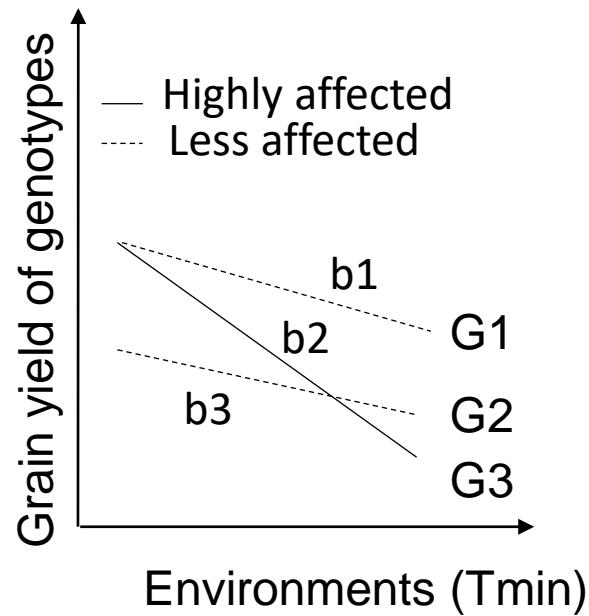

RILs Atil x *T. Dicoccum*.

# New traits - Effect of night temperature

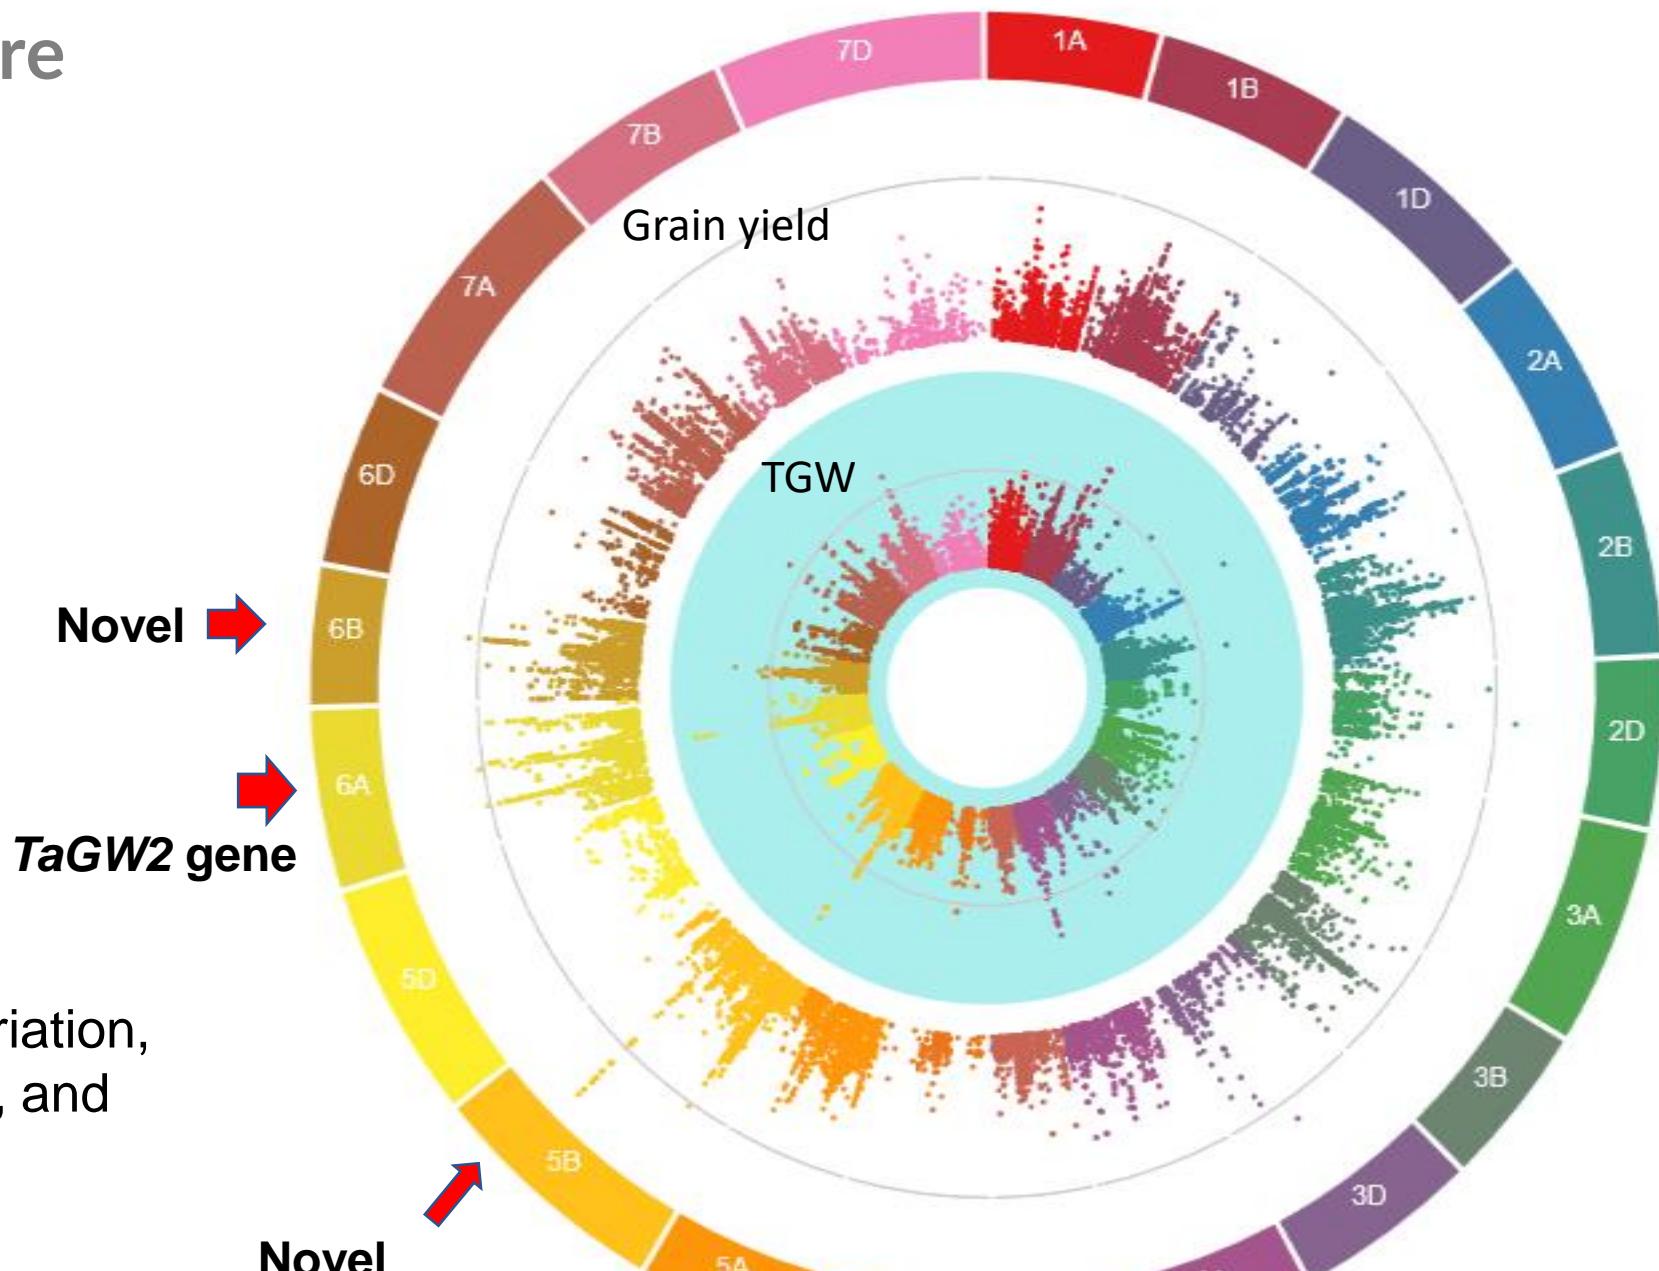

# Effect of night temperature

Slope of reaction of genotypes to Tmin

**TaGW2** gene is involved in trait variation, response to nighttime temperature, and phenotypic plasticity

# In summary

- ✓ Genomics technologies are increasingly used also in public sector wheat breeding
- ✓ The development and implementation of well-defined, effective deployment strategies for the many genomics outputs depending on trait complexity is becoming a significant component in breeding
- ✓ Validation of genomics outputs is time consuming and costly, often underestimated and insufficiently funded
- ✓ Evaluation of diverse germplasm remains key for future progress and genetic gain

Research  
Program on  
WHEAT

The CGIAR  
Research Program  
WHEAT receives  
W1&W2  
support from the  
Governments of  
Australia,  
Belgium, Canada,  
China, France,  
India, Japan,  
Korea,  
Netherlands, New  
Zealand, Norway,  
Sweden,  
Switzerland, U.K.,  
U.S., and the  
World Bank.
